Intelligent Control Systems 1990 American Society of Mechanical Engineers. Winter Annual Meeting, 1990

Intelligent Machines Clarence W. de Silva, 2000-06-22 What is intelligence Are truly intelligent machines a practical reality If so can they work in harmony with human beings and improve the quality of our lives How are they designed built and controlled The fact is that machines with brains are no longer the stuff of science fiction Research focused on developing smarter more flexible

Methods and Applications of Intelligent Control S.G. Tzafestas, 2012-12-06 This book is concerned with Intelligent Control methods and applications The field of intelligent control has been expanded very much during the recent years and a solid body of theoretical and practical results are now available These results have been obtained through the synergetic fusion of concepts and techniques from a variety of fields such as automatic control systems science computer science neurophysiology and operational research Intelligent control systems have to perform anthropomorphic tasks fully autonomously or interactively with the human under known or unknown and uncertain environmental conditions Therefore the basic components of any intelligent control system include cognition perception learning sensing planning numeric and symbolic processing fault detection repair reaction and control action These components must be linked in a systematic synergetic and efficient way Predecessors of intelligent control are adaptive control self organizing control and learning control which are well documented in the literature Typical application examples of intelligent controls are intelligent robotic systems intelligent manufacturing systems intelligent medical systems and intelligent space teleoperators Intelligent controllers must employ both quantitative and qualitative information and must be able to cope with severe temporal and spatial variations in addition to the fundamental task of achieving the desired transient and steady state performance Of course the level of intelligence required in each particular application is a matter of discussion between the designers and users The current literature on intelligent control is increasing but the information is still available in a sparse and disorganized way

Handbook of Intelligent Control David A. White, Donald A. Sofge, 1992 This handbook shows the reader how to develop neural networks and apply them to various engineering control problems Based on a workshop on aerospace applications this tutorial covers integration of neural networks with existing control architectures as well as new neurocontrol architectures in nonlinear control

J. Inman,1995 This book is a collection of papers on the subject of applied system dynamics and control written by experts in this field It offers the reader a sampling of exciting research areas in three fast growing branches i Wave Motion ii Intelligent Structures iii Nonlinear Mechanics The topics covered include flow instability nonlinear mode localization autoparametric systems with pendula and geometric stiffening in multibody dynamics Mathematical methods include perturbation methods modern control theory nonlinear neural nets and resonance scattering theory of Berall Ripoche Maze Applications include sound induced structural vibrations fiber acoustic waveguides vibration suppression of structures linear control of gyroscopic systems and nonlinear control of distributed systems This book shows how applied system dynamics and control is currently being utilized and investigated It will be of interest to engineers applied mathematicians and physicists Revival: Twelfth International Conference on Adaptive Structures and Technologies (2002) Norman Wereley, Inderjit Chopra, Darryll Pines, 2017-11-22 This paper reviews some of the important technical barriers that must be overcome to achieve truly efficient flying adaptive micro air vehicles MAVs As defined by the Defense Advanced Research Agency DARPA MAVs are vehicles with no length dimension greater than 6 inches These vehicles typically weigh less than 100 grams and some can fly for approximately 30 minutes Over the past decade significant progress has been made in developing these small scale mechanical flying machines However there is still much work to be done if these vehicles are to approach the efficiency and performance of biological fliers This paper reviews the status of current miniature mechanical flying machines and compares their performance with common biological flyers such as birds and small insects This comparison reveals that advances in aerodynamic efficiency lightweight and adaptive wing structures energy conversion propulsion systems and flight control are required to match or exceed the performance of nature's great flyers **Neural Systems for Control** Omid Omidvar, David L. Elliott, 1997-02-24 Control problems offer an industrially important application and a guide to understanding control systems for those working in Neural Networks Neural Systems for Control represents the most up to date developments in the rapidly growing application area of neural networks and focuses on research in natural and artificial neural systems directly applicable to control or making use of modern control theory The book covers such important new developments in control systems such as intelligent sensors in semiconductor wafer manufacturing the relation between muscles and cerebral neurons in speech recognition online compensation of reconfigurable control for spacecraft aircraft and other systems applications to rolling mills robotics and process control the usage of past output data to identify nonlinear systems by neural networks neural

approximate optimal control model free nonlinear control and neural control based on a regulation of physiological investigation blood pressure control All researchers and students dealing with control systems will find the fascinating Neural Systems for Control of immense interest and assistance Focuses on research in natural and artificial neural systems directly applicable to control or making use of modern control theory Represents the most up to date developments in this rapidly growing application area of neural networks Takes a new and novel approach to system identification and synthesis

Technology for Large Space Systems, 1989 **Intelligent Sensors** H. Yamasaki, 1996-04-22 Sensors are the front end devices for information acquisition from the natural and or artificial world Higher performance of advanced sensing systems is achieved by using various types of machine intelligence Intelligent sensors are smart devices with signal processing functions shared by distributed machine intelligence Typical examples of intelligent sensors are the receptors and dedicated signal processing systems of the human sensory systems The most important job of information processing in the sensory system is to extract necessary information from the receptors signals and transmit the useful information to the brain This dedicated information processing is carried out in a distributed manner to reduce the work load of the brain The processing also lightens the load of signal transmission through the neural network the capacity of which is limited Although the performance of the receptors in our human sensory system is not always ideal and is frequently inferior to that of man made sensors the total performance is usually far superior to those of our technical sensing systems The weak points of human receptors are masked by the information processing This processing makes our sensory system adaptable to the environment and optimizes system performance The basic idea of this book which contains new computing paradigms is that the most advanced intelligent sensing system is the human sensory system Section I reviews the technologies of intelligent sensors and discusses how they developed Typical approaches for the realization of intelligent sensors emphasizing the architecture of intelligent sensing systems are also described In section II fundamental technologies for the fabrication of intelligent sensors and actuators are presented Integration and micro miniaturization techniques are emphasized Section III presents advanced technologies approaching human sensory systems these technologies are not directly aimed at practical applications but introduce the readers to the development of engineering models of sensory systems Technologies of integrated intelligent sensors which will shortly be in use are introduced in section IV In section V examples are given of intelligent sensing systems which are used in industrial installations Hardware for machine intelligence is not integrated at present but can soon be implemented in the monolithic integrated structure Without this machine intelligence new functions for example self diagnosis or defects identification cannot be realized This section also demonstrates the potential of intelligent sensors in industry Section VI introduces two interesting topics which are closely related to intelligent sensing systems The first one is multisensor fusion It is expected to be one of the fundamental and powerful technologies for realizing an advanced intelligent sensing systems The second is visualizing technology of the sensed states for easy comprehension of

the dynamic multi dimensional state This is useful for intelligent man machine interfaces This book will be recognised by readers as a milestone in the rapid progress of intelligent sensors
