Neuropharmacology Methods in Epilepsy Research Steven L. Peterson, Timothy E. Albertson, 2019-05-07 There is an estimated 2.5 million epileptics in the US and perhaps some 40 million worldwide As research has become increasingly molecular in scope fewer scientists are trained in the US on basic integrated epilepsy techniques One frustration in neuroscience today is the application of state of the art molecular biology techniques to inappropriate animal models of epilepsy frequently resulting in inconclusive results Epilepsy research will be increasingly undertaken by scientists well trained in reductionist methodology but who may be unfamiliar with integrated whole animal

techniques This situation appears even more difficult considering there has been no updated textbook on experimental models of epilepsy over the last twenty years until now Neuropharmacology Methods in Epilepsy Research describes fundamental methodologies and procedures in this field representing the only detailed text concerning experimental models of epilepsy published in the last 20 years This guide studies the reproduction of well characterized and readily interpretable experimental models of epilepsy to which state of the art molecular biology techniques can be applied Each chapter features Introduction providing a brief background and historical account of the techniques and their use Methodology describing equipment solutions species electrodes as well as considering variations of techniques and stimulation parameters Interpretations demonstrating the relevance of techniques to epilepsy as well as describing what exactly is being studied and how the data is appropriately applied to understanding epilepsy Topics include electroshock chemoconvulsions kindling audiogenic seizures focal seizures and brain slice preparations Discussions also include Recently developed seizure models including status epilepticus and massed trial simulations Influence of circadian and diurnal rhythms on convulsive activity Behavioral and cognitive deficits associated with anticonvulsant drug testing Technical approaches i e slice models microdialysis techniques intracranial implant surgery audiogenic seizure testing kindling paradigms and the rhythmic nature of seizures This unique text provides a thorough reference for the diverse methodologies within this area of neuropharmacological research providing the basis for on going cellular and molecular investigations as well as novel therapeutic approaches to the treatment of epilepsy

Behavioural Models in Psychopharmacology Paul Willner, 1991-02-21 Behavioural models in psychopharmacology are used for different purposes The main concern of industrial psychopharmacologists is specifically to develop new and improved drugs for the treatment of mental disorders while basic scientists use animal models to investigate the underlying nature of such conditions The important distinction between these different perspectives is made explicit for the first time in this book By considering such conditions as anxiety depression mania and schizophrenia feeding disorders dementia and drug dependence this book provides a comprehensive and critical review of the adequacy of the behavioural procedures used by psychopharmacologists to model psychiatric disorders Graduate students and research workers in psychopharmacology from both academic and industrial spheres as well as clinicians will find this book of considerable interest
