## The nervous system

The nervous system is composed of two integrated subdivisions: an extensive peripheral nervous system, which transmits information to and from the central nervous system (CNS) and the brain.

The CNS includes the brain and spinal cord, which are covered by protective meninges called the leptomeninges (pia mater, arachnoid mater, and dura mater). The brain is the central command center, and the spinal cord is the main communication pathway between the brain and the rest of the body.

The peripheral nervous system (PNS) includes all the nerves and ganglia outside the CNS. It is responsible for transmitting information between the CNS and the rest of the body.

The nervous system is divided into two main parts: the central nervous system (CNS) and the peripheral nervous system (PNS). The CNS is located in the head and neck, and the PNS is located throughout the rest of the body.

Spinal cord

## The spinal cord and nerves

The spinal cord is a long, thin, tube-shaped structure that runs from the base of the brain down to the lower back. It is composed of 31 pairs of spinal nerves, which are responsible for transmitting information between the brain and the rest of the body.

## Structure of motor neurons

Motor neurons are specialized cells that transmit information from the brain to the muscles and glands. They are composed of a cell body (soma) and a long, thin process called an axon.

## Synaptic knob or axon terminal of presynaptic neuron

## What are synaptic connections?

Synaptic connections are the points where two neurons meet and communicate. They are formed by the axon terminal of one neuron and the dendrite of another neuron.

## The brain

The brain is the central command center of the nervous system. It is composed of the cerebrum, cerebellum, and brainstem.
