

EAGLE POWER
Fleagle had long known that a little more than human power was needed to fly.

Powered flight

WITH A GLIDER, it was at last possible to fly on wings – but not for long. To fly any real distance, an engine was needed. By as early as 1845, two Englishmen, William Henson and John Stringfellow, had built a working model of a plane powered by a specially made lightweight steam engine – the only engine then available. Nobody knows whether their model ever really got off the ground, but it showed that the idea of a powered flying machine was no longer just a dream. Over the next 50 years, many imaginative engineers tried to get steam-powered flying machines airborne, both models and full-size aeroplanes. But steam engines proved either too weak or too heavy, and it needed the invention of compact, powerful petrol engines for powered flight to become a real possibility.

STEAM POWER

Henson and Stringfellow built a special lightweight steam engine for their model, with the engine no longer than 25 in (63.5) tall. Heat for the engine came from a naptha or spirit burner, and steam was raised in the now of several tubes. (In the full-size version, the boiler would have had 50 of these tubes, but the engine was never built.) Steam from the boiler drove the piston up and down, turning the wooden pulley wheel. This, in turn, spun the two propellers via a frame drive belt.

WING DRIVE

Stringfellow built another model in 1848. To launch it, he ran it down a sloping wire for 20 in (50.8) and then released it with the engine running. Some accounts say the model showed true powered flight by climbing a little before it hit a wall.
