

BINARY ARITHMETIC

Binary addition

Adding binary numbers is a very simple task, and very similar to the longhand addition of decimal numbers. As with decimal numbers, you start by adding the bits (digits) one column, or place weight, at a time, from right to left. Unlike decimal addition, there is little memorizing in the way of rules for the addition of binary bits:

```
0 + 0 = 0
1 + 0 = 1
0 + 1 = 1
1 + 1 = 10
1 + 1 = 1 + 1 = 11
```

Just as with decimal addition, when the sum in one column is a two-bit (two-digit) number, the least significant figure is written as part of the total sum and the most significant figure is "carried" to the next left column. Consider the following examples:

		11 1 <--- Carry bits <---> 11
1001101	1001001	1000111
+ 0010010	+ 0011001	+ 0010110
-----	-----	-----
1011111	1100010	1011101

The addition problem on the left did not require any bits to be carried, since the sum of bits in each column was either 1 or 0, not 10 or 11. In the other two problems, there definitely were bits to be carried, but the process of addition is still quite simple.

As we'll see later, there are ways that electronic circuits can be built to perform this very task of addition, by representing each bit of each binary number as a voltage signal (either "high," for a 1; or "low" for a 0). This is the very foundation of all the arithmetic which modern digital computers perform.

Subtraction

We can subtract one binary number from another by using the standard techniques adapted for decimal numbers (subtraction of each bit pair, right to left, "borrowing" as needed from bits to the left). However, if we can leverage the already familiar (and easier) technique of binary addition to subtract, that would be better. As we just learned, we can represent negative binary

Niklaus Wirth, 2012-12-06 This book emerged from lecture notes of a course taught in the second year to students of Computer Science at the Federal Institute of Technology Zurich The topic of hardware design plays a relatively minor role in Computer Science curricula at many universities Most courses concentrate on the various aspects of theory software and of information systems Students therefore obtain few opportunities to deal with concrete engineering problems and physical devices We consider this as rather unfortunate particularly for technical universities As a result we observe a growing gap between interest in and understanding of design issues involving not only software but also hardware and interfaces This is regrettable at a time when new and advanced solutions to many problems are often crucially influenced by recent hardware developments at a time when the engineer needs to be competent in both software and hardware issues in order to find an optimally integrated competitive solution It turns out that the hesitation of many students in Computer Science to take an active interest in hardware his or her daily tool does not only stem from a preference of clean abstract concepts with a corresponding distaste for dealing with concrete components construction techniques and the dirty realities inflicted by nature but also stems from the lack of a bridge between the two realms *Advances In Machine Vision: Strategies And Applications*

Colin Archibald, Emil Petriu, 1992-04-15 This book describes recent strategies and applications for extracting useful information from sensor data For example the methods presented by Roth and Levine are becoming widely accepted as the best way to segment range images and the neural network methods for Alpha numeric character recognition presented by K Yamada are believed to be the best yet presented An applied system to analyze the images of dental imprints presented by J C t et al is one of several examples of image processing systems that have already been proven to be practical and can serve as a model for the image processing system designer Important aspects of the automation of processes are presented in a practical way which can provide immediate new capabilities in fields as diverse as biomedical image processing document processing industrial automation understanding human perception and the defence industries The book is organized into sections describing Model Driven Feature Extraction Data Driven Feature Extraction Neural Networks Model Building and Applications
