Lesson 4 – Introduction to Vectors, Basic Operations on Vectors; Drawing Vectors in Mathematica; Algebra and Geometry of the Dot Product

● Definition, Notation and Basic Operations on Vectors

A (real) vector is a mathematical object which possesses a magnitude and a direction. A real number (scalar) can be thought of as a one-dimensional vector. A two- or three-dimensional vector can be represented by an arrow, whose direction shows the direction of the vector and whose length represents the magnitude. Following the most commonly accepted notation, used in most undergraduate texts, to distinguish vectors from scalars, we will reserve **bold letters** for vectors (i.e., **u** , **v** , **w** , **x** , **y** , etc.) and normal font letters for scalars. As you might imagine such a convention is not very useful for taking notes (unless you are carrying a bold pen around to use every time you need to refer to a vector). The alternative notation is as a *right arrow* symbol above the letter (in general, such a placement of a symbol is referred to as an *accent*): $\vec{u}$. This is a much more convenient notation when using pen and paper and, at the introductory level, in my opinion, it is equally beneficial in print. The keyboard shortcut for any accent is +, the shortcut for the arrow is ++++. Here, we will use the combination of the two, using bold letters with the arrow accent to denote vectors. In addition to the notation's benefit for reading and interpretation, there is yet another reason for accepting this notation that will be addressed later in the lesson.

Two vectors are equal if and only if they have equal magnitudes and the same direction. For example, the two vectors below, $\vec{a}$ and $\vec{b}$, are equal. We can think of them as the same vector positioned differently.
