Gus and Al Albert Innaurato, 1989 *Advances in Food and Nutrition Research*, 1992-08-24 *Advances in Food and Nutrition Research* *Crop Biofortification* Adnan Noor Shah, Sajid Fiaz, Muhammad Aslam, Javed Iqbal, Abdul Qayyum, 2025-06-03 Develop more nutritious crops to aid in the fight against world hunger with this timely volume One in nine people worldwide suffer from hunger or food scarcity Massively increasing food production is one of the most urgent scientific projects in the modern world particularly as a changing climate places increasing pressure on the global food supply and on sustainable food production processes Biofortification is a process in which plant breeding improved agronomic practices and or modern biotechnology are employed to increase nutrient density of crops without sacrificing any of their desirable characteristics It s an essential tool in the global fight against hunger Crops Biofortification offers an up to the minute overview of this essential subject and its recent advances It covers all the latest methodologies and techniques deployed in biofortification as well as surveying plant responses to genetically induced biofortification and the effect of climate change on biofortified crops Designed to allow for the application of these techniques at the field level it s a significant contribution towards the search for a sustainable global food supply Crops Biofortification readers will also find Presentation of recent advances in omics particularly metabolomics which can decipher potential changes in plants caused by biofortification Detailed discussion of methods for increasing the nutritional content of edible plants to address specific nutritional deficiencies Contributions towards a road map for increasing global food production by 70% before the year 2050 Crops Biofortification is ideal for researchers policymakers and professionals interested in the potential biofortification of crop plants as well as graduate and advanced undergraduate students in agronomy plant physiology plant breeding and genetics agricultural biotechnology and related fields **Genetic Transformation of Plants** John Flex Jackson, Hans F. Linskens, 2013-03-09 *Molecular Methods of Plant Analysis* Concept of the Series The powerful recombinant DNA technology and related developments have had an enormous impact on molecular biology Any treatment of plant analysis must make use of these new methods Developments have been so fast and the methods so powerful that the editors of *Modern Methods of Plant Analysis* have now decided to rename the series *Molecular Methods of Plant Analysis* This will not change the general aims of the series but best describes the thrust and content of the series as we go forward into the new millennium This does not mean that all chapters apriori deal only with the methods of molecular biology but rather that these methods are to be found in many chapters together with the more traditional methods of analysis which have seen recent advances The numbering of the volumes of the series therefore continues on from 20 which is the most recently published volume under the title *Modern Methods of Plant Analysis* *Progress in Botany* Ulrich Lüttge, Wolfram Beyschlag, Dennis Francis, John Cushman, 2012-10-24 With one volume each year this series keeps scientists and advanced students informed of the latest developments and results in all areas of the plant sciences The present volume includes reviews on genetics cell

When Chemistry Meets

Biology - Generating Innovative Concepts, Methods and Tools for Scientific Discovery in the Plant Sciences Erich Kombrink, Markus Kaiser, 2016-08-12 Biologically active small molecules have increasingly been applied in plant biology to dissect and understand biological systems This is evident from the frequent use of potent and selective inhibitors of enzymes or other biological processes such as transcription translation or protein degradation In contrast to animal systems which are nurtured from drug research the systematic development of novel bioactive small molecules as research tools for plant systems is a largely underexplored research area This is surprising since bioactive small molecules bear great potential for generating new powerful tools for dissecting diverse biological processes In particular when small molecules are integrated into genetic strategies thereby defining chemical genetics they may help to circumvent inherent problems of classical forward genetics There are now clear examples of important fundamental discoveries originating from plant chemical genetics that demonstrate the power but not yet fully exploited potential of this experimental approach These include the unraveling of molecular mechanisms and critical steps in hormone signaling activation of defense reactions and dynamic intracellular processes The intention of this Research Topic of Frontiers in Plant Physiology is to summarize the current status of research at the interface between chemistry and biology and to identify future research challenges The research topic covers diverse aspects of plant chemical biology including the identification of bioactive small molecules through screening processes from chemical libraries and natural sources which rely on robust and quantitative high throughput bioassays the critical evaluation and characterization of the compound s activity selectivity and ultimately the identification of its protein target s and mode of action which is yet the biggest challenge of all Such well characterized selective chemicals are attractive tools for basic research allowing the functional dissection of plant signaling processes or for applied purposes if designed for protection of crop plants from disease New methods and data mining tools for assessing the bioactivity profile of compounds exploring the chemical space for structure function relationships and comprehensive chemical fingerprinting metabolomics are also important strategies in plant chemical biology In addition there is a continuing need for diverse target specific bioprobes that help profiling enzymatic activities or selectively label protein complexes or cellular compartments To achieve these goals and to add suitable probes and methods to the experimental toolbox plant biologists need to closely cooperate with synthetic chemists The development of such tailored chemicals that beyond application in basic research can modify traits of crop plants or target specific classes of weeds or pests by collaboration of applied and academic research groups may provide a bright future for plant chemical biology The current Research Topic covers the breadth of the field by presenting original research articles methods papers reviews perspectives and opinions

Crop Improvement Khalid Rehman Hakeem, Parvaiz Ahmad, Munir Ozturk, 2013-06-13 The improvement of crop species has been a basic pursuit since cultivation began thousands of years ago To feed an ever increasing world population will require a great increase in food

production Wheat corn rice potato and few others are expected to lead as the most important crops in the world Enormous efforts are made all over the world to document as well as use these resources Everybody knows that the introgression of genes in wheat provided the foundation for the Green Revolution Later also demonstrated the great impact that genetic resources have on production Several factors are contributing to high plant performance under different environmental conditions therefore an effective and complementary use of all available technological tools and resources is needed to meet the challenge

Genetically Engineered Viruses Dr Eddie Blair, Dr Chris J A Ring, 2023-05-31 This book combines an up to date summary of how best to genetically engineer viruses with an overview of basic virology This unique combination makes it an invaluable research tool for virologists and molecular biologists seeking to exploit viruses for a range of applications Written by highly respected authors the book also provides comparisons to and guidelines for the use of viruses in difference applications

Strawberry Amjad M. Husaini, Davide Neri, 2016-10-17 Methods of strawberry cultivation have undergone extensive modification and this book provides an up to date broad and balanced scientific review of current research and emerging challenges Subjects covered range from plant propagation architecture genetic resources breeding abiotic stresses and climate change to evolving diseases and their control These topics are examined in three sections 1 Genetics Breeding and Omics covering genetic resources breeding metabolomics transcriptomics and genetic transformation of strawberry 2 Cultivation Systems and Propagation discusses plant architecture replanting problems and plant propagation techniques 3 Disease and Stress Management deals with traditional and emerging fungal diseases their diagnosis and modern biocontrol strategies and biotechnological interventions for dealing with the challenges of climate change Strawberry Growth Development and Diseases is written by an international team of specialists using figures and tables to make the subject comprehensible and informative It is an essential resource for academics and industry workers involved in strawberry research and development and all those interested in the commercial cultivation of strawberries

Somatic Embryogenesis in Woody Plants S.M. Jain, Pramod P.K. Gupta, R.J. Newton, 2012-12-06 The quality of human life has been maintained and enhanced for generations by the use of trees and their products In recent years ever rising human population growth has put a tremendous pressure on trees and tree products growing awareness of the potential of previously unexploited tree resources and environmental pollution have both accelerated the development of new technologies for tree propagation breeding and improvement Biotechnology of trees may be the answer to solve the problems which can not be solved by conventional breeding methods The combination of biotechnology and conventional methods such as plant propagation and breeding could become a novel approach to improving and multiplying a large number of the trees and woody plants So far plant tissue culture technology has largely been exploited by commercial companies in propagation of ornamentals especially foliage house plants Generally tissue culture of woody plants has been recalcitrant However limited success has been achieved in tissue culture of angiosperm and gymnosperm woody plants A number of recent reports on

somatic embryogenesis in woody plants such as Norway spruce *Picea abies* Loblolly pine *Pinus taeda* Sandalwood *Santalum album* Citrus and mango *Mangifera indica* offer a ray of hope for inexpensive clonal propagation for large scale production of plants or emblings or somatic seedlings protoplast work cryopreservation genetic transformation and synthetic or artificial or manufactured seed production **General Technical Report RM.** ,1997 **Multi-omics Profiling of Unique Niches to**

Reveal the Microbial and Metabolite Composition Roshan Kumar,Vasvi Chaudhry,Om Prakash,2022-09-29 **Molecular improvement of cereal crops** Indra K. Vasil,2012-12-06 From the pre historic era to modern times cereal grains have been the most important source of human nutrition and have helped sustain the increasing population and the development of human civilization In order to meet the food needs of the 21st century food production must be doubled by the year 2025 and nearly tripled by 2050 Such enormous increases in food productivity cannot be brought about by relying entirely on conventional breeding methods especially on less land per capita with poor quality and quantity of water and under rapidly deteriorating environmental conditions Complementing and supplementing the breeding of major food crops such as the cereals which together account for 66% of the world food supply with molecular breeding and genetic manipulation may well provide a grace period of about 50 years in which to control population growth and achieve sustainable development In this volume leading world experts on cereal biotechnology describe the production and commercialization of the first generation of transgenic cereals designed to substantially reduce or prevent the enormous losses to cereal productivity caused by competition with weeds and by various pests and pathogens which is an important first step in that direction

From Functional Genomics to Biotechnology in Ornamental Plants Swee-Suak Ko, Akira Kanno, Raquel Sánchez-Pérez, Hsin-Hung Yeh, Annette Hohe, Mariana Mondragón-Palomino, 2019-07-12 For centuries plants of a broad taxonomical background have been bred and commercialized because of the beauty of their flowers However until recently genomic analyses of ornamentals remained a challenge because of their large genome sizes and high ploidy levels In the last decade increasingly affordable sequencing technologies and powerful bioinformatic approaches resulted in the complete sequencing of several horticultural species genomes and the characterization of their transcriptomes These developments enabled research on many challenging topics This Research Topic gives you a primer into them by featuring a broad range of original research contributions on some of the most active areas of ornamental plant research the genetic basis of flower morphology scent and color the genetic regulation of physiology as well as the epigenetic factors affecting vegetative development In this context one of the most significant hurdles to functional genetic studies in ornamentals is achieving efficient genetic transformation Several articles in this Research Topic describe strategies to tackle this challenge and present insights into the way transgene activity renders novel flower phenotypes

Thematic Background Study - Genetic resources for farmed seaweeds Hurtado, A.Q., 2022-01-21 The increasing global population needs to source food from the ocean which is a much greater area than the land The ocean is rich with diversified flora and fauna and both are sources of proteins vitamins minerals phytohormones and bioactive compounds Thousands of species of macroalgae seaweed dominate the vegetation of the seafloor from the intertidal to the subtidal zone The domestication of several economically important seaweed such as *Saccharina* *Undaria* and *Pyropia* in China Japan and the Republic of Korea and *Kappaphycus* and *Eucheuma* in Indonesia

Malaysia the Philippines and the United Republic of Tanzania led to the intensive commercial cultivation of these seaweeds. Except for the United Republic of Tanzania the commercial farming of seaweed both temperate and tropical species is centred in Asia. Despite the presence of several economically important seaweeds outside Asia commercial farming is practised only in a few of non Asian countries. These include Chile for *Gracilaria* and *Macrocystis* Buschmann et al 2001, France for *Palmaria palmata*, *Porphyra umbilicalis* and *Undaria pinnatifida* Netalgae and Canada for *Saccharina latissima* in integrated multi trophic aquaculture IMTA Chopin et al 2013 and *Chondrus crispus*. Trial cultivation of *Saccharina* spp and *P. palmata* is now taking place in Western Europe. Seaweeds are farmed mainly for food such as sea vegetables and food ingredients Bixler and Porse 2011 as well as feed Wilke et al 2015 Norambuena et al 2015. However there is increasing interest in their use for biorefinery products that require a vast amount of biomass which must be farmed.
