History Of Approximation Theory From Eul:

The History of Approximation Theory Karl-Georg Steffens, 2007-07-28 Exciting exposition integrates history philosophy and mathematics Combines a mathematical analysis of approximation theory with an engaging discussion of the differing philosophical underpinnings behind its development Appendices containing biographical data on numerous eminent mathematicians explanations of Russian nomenclature and academic degrees and an excellent index round out the presentation

Translations: Number theory and analysis American Mathematical Society, 1962 **The Formation of Shocks in 3-dimensional Fluids** Demetrios Christodoulou, 2007 The equations describing the motion of a perfect fluid were first formulated by Euler in 1752 These equations were among the first partial differential equations to be written down but after a lapse of two and a half centuries we are still far from adequately understanding the observed phenomena which are supposed to lie within their domain of validity These phenomena include the formation and evolution of shocks in compressible fluids the subject of the present monograph The first work on shock formation was done by Riemann in 1858 However his analysis was limited to the simplified case of one space dimension Since then several deep physical insights have been attained and new methods of mathematical analysis invented Nevertheless the theory of the formation and evolution of shocks in real three dimensional fluids has remained up to this day fundamentally incomplete This monograph considers the relativistic Euler equations in three space dimensions for a perfect fluid with an arbitrary equation of state The author considers initial data for these equations which outside a sphere coincide with the data corresponding to a constant state Under suitable restriction on the size of the initial departure from the constant state he establishes theorems that give a complete description of the maximal classical development In particular it is shown that the boundary of the domain of the maximal classical development has a singular part where the inverse density of the wave fronts vanishes signalling shock formation The theorems give a detailed description of the geometry of this singular boundary and a detailed analysis of the behavior of the solution there A complete picture of shock formation in three dimensional fluids is thereby obtained The approach is geometric the central concept being that of the acoustical spacetime manifold
