Logics And Languages:

Logics and Languages Max Cresswell, 2016-08-12 Originally published in 1973 this book shows that methods developed for the semantics of systems of formal logic can be successfully applied to problems about the semantics of natural languages and moreover that such methods can take account of features of natural language which have often been thought incapable of formal treatment such as vagueness context dependence and metaphorical meaning Parts 1 and 2 set out a class of formal languages and their semantics Parts 3 and 4 show that these formal languages are rich enough to be used in the precise description of natural languages Appendices describe some of the concepts discussed in the text **Language and Logics**

Introduction to Languages, Machines and Logic Alan P. Parkes, 2012-12-06 1 1 Overview This chapter briefly describes what this book is about what this book tries to do what this book tries not to do a useful feature of the book the exercises 1 2 What This Book Is About This book is about three key topics of computer science namely computable languages abstract machines and logic Computable languages are related to what are usually known as formal languages I avoid using the latter phrase here because later on in the book I distinguish between formal languages and computable languages In fact computable languages are a special type of formal languages that can be processed in ways considered in this book by computers or rather abstract machines that represent computers Abstract machines are formal computing devices that we use to investigate properties of real computing devices The term that is sometimes used to describe abstract machines is automata but that sounds too much like real machines in particular the type of machines we call robots The logic part of the book considers using different types of formal logic to represent things and reason about them The logics we

consider all play a very important role in computing They are Boolean logic propositional logic and first order predicate logic FOPL

Language in Action Johan van Benthem,1995 Language in Action demonstrates the viability of mathematical research into the foundations of categorial grammar a topic at the border between logic and linguistics Since its initial publication it has become the classic work in the foundations of categorial grammar A new introduction to this paperback edition updates the open research problems and records relevant results through pointers to the literature Van Benthem presents the categorial processing of syntax and semantics as a central component in a more general dynamic logic of information flow in tune with computational developments in artificial intelligence and cognitive science Using the paradigm of categorial grammar he describes the substructural logics driving the dynamics of natural language syntax and semantics This is a general type theoretic approach that lends itself easily to proof theoretic and semantic studies in tandem with standard logic The emphasis is on a broad landscape of substructural categorial logics and their proof theoretical and semantic peculiarities This provides a systematic theory for natural language understanding admitting of significant mathematical results Moreover the theory makes possible dynamic interpretations that view natural languages as programming formalisms for various cognitive activities

Logics of Specification Languages Dines Bjørner,Martin C. Henson,2007-12-05 This book presents comprehensive studies on nine specification languages and their logics of reasoning The editors and authors are authorities on these specification languages and their application In a unique feature the book closes with short commentaries on the specification languages written by researchers closely associated with their original development The book contains extensive references and pointers to future developments

Puzzles in Logic, Languages and Computation Dragomir Radev,2013-02-11 This is the second volume of a unique collection that brings together the best English language problems created for students competing in the Computational Linguistics Olympiad These problems are representative of the diverse areas presented in the competition and designed with three principles in mind To challenge the student analytically without requiring any explicit knowledge or experience in linguistics or computer science To expose the student to the different kinds of reasoning required when encountering a new phenomenon in a language both as a theoretical topic and as an applied problem To foster the natural curiosity students have about the workings of their own language as well as to introduce them to the beauty and structure of other languages To learn about the models and techniques used by computers to understand human language Aside from being a fun intellectual challenge the Olympiad mimics the skills used by researchers and scholars in the field of computational linguistics In an increasingly global economy where businesses operate across borders and

languages having a strong pool of computational linguists is a competitive advantage and an important component to both security and growth in the 21st century This collection of problems is a wonderful general introduction to the field of linguistics through the analytic problem solving technique A fantastic collection of problems for anyone who is curious about how human language works These books take serious scientific questions and present them in a fun accessible way Readers exercise their logical thinking capabilities while learning about a wide range of human languages linguistic phenomena and computational models Kevin Knight USC Information Sciences Institute *Logics in Artificial Intelligence* Sergio Flesca, 2002-09-11 This book constitutes the refereed proceedings of the European Conference on Logics in Artificial Intelligence JELIA 2002 held in Cosenza Italy in September 2002 The 41 revised full papers presented together with 11 system descriptions and 3 invited contributions were carefully reviewed and selected from more than 100 submissions The papers are organized in topical sections on multi agent systems evolution and changes description logic and the semantic web complexity issues probabilistic logic AI planning modal logic and causal reasoning theory reasoning under uncertainty satisfiability paraconsistent reasoning actions and caution logic for agents semantics and optimization issues in answer set semantics *Programming Language Implementation and Logic Programming* Jan Małuszyński, Martin Wirsing, 1991-08-14 This volume contains the papers which have been accepted for presentation at the Third International Symposium on Programming Language Implementation and Logic Programming PLILP 91 held in Passau Germany August 26 28 1991 The aim of the symposium was to explore new declarative concepts methods and techniques relevant for the implementation of all kinds of programming languages whether algorithmic or declarative ones The intention was to gather researchers from the fields of algorithmic programming languages as well as logic functional and object oriented programming This volume contains the two invited talks given at the symposium by H Ait Kaci and D B MacQueen 32 selected papers and abstracts of several system demonstrations The proceedings of PLILP 88 and PLILP 90 are available as Lecture Notes in Computer Science Volumes 348 and 456 The Languages of Logic Samuel Guttenplan, 1997-05-28 With the same intellectual goals as the first edition this innovative introductory logic textbook explores the relationship between natural language and logic motivating the student to acquire skills and techniques of formal logic This new and revised edition includes substantial additions which make the text even more useful to students and instructors alike Central to these changes is an Appendix How to Learn Logic which takes the student through fourteen compact and sharply directed lessons with exercises and answers On the Logic and Learning of Language Sean A. Fulop, 2004 This book presents the author's research on automatic learning procedures for categorial grammars of natural languages The research program spans a number of intertwined disciplines including syntax semantics learnability theory logic and computer science The theoretical framework employed is an extension of categorial grammar that has come to be called multimodal or type logical grammar The first part of the book presents an expository summary of how grammatical sentences of any language can be deduced with a specially

designed logical calculus that treats syntactic categories as its formulae Some such Universal Type Logic is posited to underlie the human language faculty and all linguistic variation is captured by the different systems of semantic and syntactic categories which are assigned in the lexicons of different languages The remainder of the book is devoted to the explicit formal development of computer algorithms which can learn the lexicons of type logical grammars from learning samples of annotated sentences The annotations consist of semantic terms expressed in the lambda calculus and may also include an unlabeled tree structuring over the sentence The major features of the research include the following We show how the assumption of a universal linguistic component the logic of language is not incompatible with the conviction that every language needs a different system of syntactic and semantic categories for its proper description The supposedly universal linguistic categories descending from antiquity noun verb etc are summarily discarded Languages are here modeled as consisting primarily of sentence trees labeled with semantic structures a new mathematical class of such term labeled tree languages is developed which cross cuts the well known Chomsky hierarchy and provides a formal restrictive condition on the nature of human languages The human language acquisition mechanism is postulated to be biased such that it assumes all input language samples are drawn from the above syntactically homogeneous class in this way the universal features of human languages arise not just from the innate logic of language but also from the innate biases which govern language learning This project represents the first complete explicit attempt to model the acquisition of human language since Steve Pinker's groundbreaking 1984 publication *Language Learnability and Language Development*

 Logics are a family of knowledge representation languages that have been studied extensively in Artificial Intelligence over
 the last two decades They are embodied in several knowledge based systems and are used to develop various real life
 applications The Description Logic Handbook provides a thorough account of the subject covering all aspects of research in
 this field namely theory implementation and applications Its appeal will be broad ranging from more theoretically oriented
 readers to those with more practically oriented interests who need a sound and modern understanding of knowledge
 representation systems based on Description Logics The chapters are written by some of the most prominent researchers in
 the field introducing the basic technical material before taking the reader to the current state of the subject and including
 comprehensive guides to the literature In sum the book will serve as a unique reference for the subject and can also be used
 for self study or in conjunction with Knowledge Representation and Artificial Intelligence courses **Functional and
