The book presents the basic biological mechanisms of how cloning works and progresses to discuss current and potential applications in basic biology, agriculture, biotechnology, and medicine. Beginning with the history and theory behind cloning, the book goes on to examine methods of micromanipulation, nuclear transfer, genetic modification, and pregnancy and neonatal care of cloned animals. The cloning of various species including mice, sheep, cattle, and non-mammals is considered as well. The Editors have been involved in a number of breakthroughs using cloning techniques including the first demonstration that cloning works in differentiated cells done by the Recipient of the 2012 Nobel Prize for Physiology or Medicine, Dr. John Gurdon, the cloning of the first mammal from a somatic cell, Drs. Keith Campbell and Ian Wilmut, the demonstration that cloning can reset the biological clock, Drs. Michael West and Robert Lanza, the demonstration that a terminally differentiated cell can give rise to a whole new individual, Dr. Rudolf Jaenisch, and the cloning of the first transgenic bovine from a differentiated cell, Dr. Jose Cibelli. The majority of the contributing authors are the principal investigators on each of the animal species cloned to date and are expertly qualified to present the state of the art information in their respective areas.
