Immunobiology of Proteins and Peptides VII M. Zouhair Atassi,2012-12-06 The articles in this volume represent papers delivered by invited speakers at the 7th International Symposium on the Immunobiology of Proteins and Peptides In addition a few of the abstracts submitted by participants were scheduled for minisymposia and some of the authors whose presentations were judged by the Scientific Council to be of high quality were invited to submit papers for publication in this volume This symposium was established in 1976 for the purpose of bringing together once every two or three years active investigators in the forefront of contemporary immunology to present their findings and discuss their significance in the light of current concepts and to identify important new directions of investigation The founding of the symposium was stimulated by the achievement of major breakthroughs in the understanding of the immune recognition of proteins and peptides We believed

that these breakthroughs will lead to the creation of a new generation of peptide reagents which should have enormous potential in biological therapeutic and basic applications This anticipated explosion has in fact since occurred and many applications of these peptides are now being realized The seventh symposium focused on immune responses that have undesirable effects on the host hence we named them unwanted immune responses Two major aspects of unwanted immune responses were discussed at the symposium Allergy and Autoimmunity **Human and Animal Relationships** D.H.

Howard,J.D. Miller,2013-04-17 Mycology the study of fungi originated as a subdiscipline of botany and was a descriptive discipline largely neglected as an experimental science until the early years of this century A seminal paper by Blakeslee in 1904 provided evidence for self incompatibility termed heterothallism and stimulated interest in studies related to the control of sexual reproduction in fungi by mating type specificities Soon to follow was the demonstration that sexually reproducing fungi exhibit Mendelian inheritance and that it was possible to conduct formal genetic analysis with fungi The names Burgeff Kniep and Lindegren are all associated with this early period of fungal genetics research These studies and the discovery of penicillin by Fleming who shared a Nobel Prize in 1945 provided further impetus for experimental research with fungi Thus began a period of interest in mutation induction and analysis of mutants for bio chemical traits Such fundamental research conducted largely with *Neurospora crassa* led to the one gene one enzyme hypothesis and to a second Nobel Prize for fungal research awarded to Beadle and Tatum in 1958 Fundamental research in biochemical genetics was extended to other fungi especially to *Saccharomyces cerevisiae* and by the mid 1960s fungal systems were much favored for studies in eukaryotic molecular biology and were soon able to compete with bacterial systems in the molecular arena **Best & Taylor's**
