Image Synthesis Elementary Algorithms:

Image Synthesis Gérard Hégron, 1988 Image Synthesis brings together all the basic techniques needed for the production of computer images. Specifically designed to be a practical tool for the user of computer graphics systems, it provides a library of correct algorithms and offers an original set of methodological procedures that will enable a user to solve problems from the particular to the most general level. The book examines the three major classes of image synthesis: curve generation, zone filling, and geometric processing, providing the fundamentals for any image synthesis system. It presents a systematic review of the algorithms needed for each class of problem, highlighting the advantages and disadvantages of each. The algorithms have been written in a descriptive language, allowing the user to program them in whatever language he or she desires. Despite the wide variety of algorithms presented, Hégron draws them together into two unifying procedures which he discusses in great detail: curve generation based on Bresenham's methods and contour following. Because these two techniques can be applied to such a diversity of problems, they provide the user with a systematic basis for a software package. Gérard Hégron is a research scientist in the National Institute of Research in Computer Science and Automatic Control (INRIA) France.

Biometric Inverse Problems Svetlana N. Yanushkevich, Adrian Stoica, Vlad P. Shmerko, Denis V. Popel, 2018-10-08 Traditional methods of biometric analysis are unable to overcome the limitations of existing approaches, mainly due to the lack of standards for input data, privacy concerns involving use and storage of actual biometric data, and unacceptable accuracy. Exploring solutions to inverse problems in biometrics transcends such limits and allows rich analysis of biometric information and systems for improved performance and testing. Although some particular inverse problems appear in the literature, until now there has been no comprehensive reference for these problems. *Biometric Inverse Problems* provides the first comprehensive treatment of biometric data synthesis and modeling. This groundbreaking reference comprises eight self-contained chapters that cover the principles of biometric inverse problems, basics of data structure design, new automatic synthetic signature, fingerprint, and iris design, synthetic faces and DNA, and new tools for biometrics based on Voronoi diagrams. Based on the authors' vast experience in the field, the book authoritatively examines new approaches and methodologies in both direct and inverse biometrics, providing invaluable analytical and benchmarking tools. The authors include case studies, examples, and implementation codes for practical illustration of the methods. Loaded with approximately 200 figures, 60 problems, 50 MATLAB code fragments, and 200 examples, *Biometric Inverse Problems* sets the standard for innovation and authority in biometric data synthesis, modeling, and analysis.
