Using bioinformatics methods to generate a systems level view of the immune system description of the main biological concepts and the new data driven algorithms Despite the fact that advanced bioinformatics methodologies have not been used as extensively in immunology as in other subdisciplines within biology research in immunological bioinformatics has already developed models of components of the immune system that can be combined and that may help develop therapies vaccines and diagnostic tools for such diseases as AIDS malaria and cancer In a broader perspective specialized bioinformatics methods in immunology make possible for the first time a systems level understanding of the immune system The traditional approaches to immunology are reductionist avoiding complexity but providing detailed knowledge of a single event cell or molecular entity Today a variety of experimental bioinformatics techniques connected to the sequencing of the human genome provides a sound scientific basis for a comprehensive description of the complex immunological processes This book offers a description of bioinformatics techniques as they are applied to immunology including a succinct account of the main biological concepts for students and researchers with backgrounds in mathematics statistics and computer science as well as explanations of the new data driven algorithms in the context of biological data that will be useful for immunologists biologists and biochemists working on vaccine design In each chapter the authors show interesting biological insights gained from the bioinformatics approach The book concludes by explaining how all the methods presented in the book can be integrated to identify immunogenic regions in microorganisms and host genomes Immunological Bioinformatics, 2005 **Immunological Bioinformatics**, 2005 **Bioinformatics for Immunomics** Darren D.R. Flower, Matthew Davies, Shoba Ranganathan, 2009-10-03 Like many words the term immunomics equates to different ideas contingent on context For a brief span immunomics meant the study of the Immunome of which there were in turn several different definitions A now largely defunct meaning rendered the Immunome as the set of antigenic peptides or immunogenic proteins within a single microorganism be that virus bacteria fungus or parasite or microbial population or antigenic or allergenic proteins and peptides derived from the environment as a whole containing also proteins from eukaryotic sources However times have changed and the meaning of immunomics has also changed Other newer definitions of the Immunome have come to focus on the plethora of immunological receptors and accessory molecules that comprise the host immune arsenal Today Immunomics or immunogenomics is now most often used as a synonym for high throughput genome based immunology This is the study of aspects of the immune system using high throughput techniques within a conceptual landscape borne of both clinical and biophysical thinking **Conceptual Modelling in Computational Immunology** Martina Husáková, 2015-09-10 Computational immunology offers in silico strategies for understanding of complex processes occurring in the natural immune system of a living organism that are difficult to explore by traditional in vivo or in vitro

techniques The monograph introduces conceptual languages and approaches for modelling biological processes The Agent Modelling Language is investigated for conceptualisation of immune processes AML based diagrams represent properties and processes occurring in a lymph node
