Topics in Polynomials of One and Several Variables and Their Applications

Themistocles M. Rassias,H. M. Srivastava,1993 This volume presents an account of some of the most important work that has been done on various research problems in the theory of polynomials of one and several variables and their applications It is dedicated to P L Chebyshev a leading Russian mathematician

Neural Network Computing for the Electric Power Industry Dejan J. Sobajic,2013-06-17 Power system computing with neural networks is one of the fastest growing fields in the history of power system engineering Since 1988 a considerable amount of work has been done in investigating computing capabilities of neural networks and understanding their relevance to providing efficient solutions for outstanding complex problems of the electric power industry A principal objective of a power utility is to provide electric

energy to its customers in a secure reliable and economic manner Toward this aim utility personnel are engaged in a variety of activities in areas of supervisory control and monitoring evaluation of operating conditions operation planning and scheduling system development equipment testing etc Over the past decades significant advances have been made in the development of new concepts design of hardware and software systems and implementation of solid state devices which all contributed to the steadily improving power system performance that we are experiencing today Advanced information processing technologies played an important role in these development efforts Members of the Special Interest Group for Power Engineering of the INNS recognized the need for bringing together leading researchers in the field of neurocomputing with experts from power utilities and manufacturing companies to assess the current state of affairs and to explore the directions of further research and practice This book is based on The Summer Workshop on Neural Network Computing for the Electric Power Industry which brought together approximately forty specialists with backgrounds in power engineering system operation and planning neural network theory and AI systems design An informal and highly inspiring atmosphere of the workshop facilitated open discussion and exchange of expertise between the participants

Cognitive Science

Harald Maurer, 2021-07-08 The Mind and Brain are usually considered as one and the same nonlinear complex dynamical system in which information processing can be described with vector and tensor transformations and with attractors in multidimensional state spaces Thus an internal neurocognitive representation concept consists of a dynamical process which filters out statistical prototypes from the sensorial information in terms of coherent and adaptive n dimensional vector fields These prototypes serve as a basis for dynamic probabilistic predictions or probabilistic hypotheses on prospective new data see the recently introduced approach of predictive coding in neurophilosophy Furthermore the phenomenon of sensory and language cognition would thus be based on a multitude of self regulatory complex dynamics of synchronous self organization mechanisms in other words an emergent flux equilibrium process steady state of the total collective and coherent neural activity resulting from the oscillatory actions of neuronal assemblies In perception it is shown how sensory object informations like the object color or the object form can be dynamically related together or can be integrated to a neurally based representation of this perceptual object by means of a synchronization mechanism feature binding In language processing it is shown how semantic concepts and syntactic roles can be dynamically related together or can be integrated to neurally based systematic and compositional connectionist representations by means of a synchronization mechanism variable binding solving the Fodor Pylyshyn Challenge Since the systemtheoretical connectionism has succeeded in modeling the sensory objects in perception as well as systematic and compositional representations in language processing with this vector and oscillation based representation format a new convincing theory of neurocognition has been developed which bridges the neuronal and the cognitive analysis level The book describes how elementary neuronal information is combined in perception and language so it becomes clear how the brain processes this information to enable basic cognitive
