Investigating patterns of change, stability, and interaction among scientific disciplines using embeddings

Barbara McGillivray¹[✉], Gard B. Jensen², Khalid Salama³ & Donna Schut⁴

Multi-disciplinary and inter-disciplinary collaboration can be an appropriate response to tackling the increasingly complex problems faced by today's society. Scientific disciplines are not rigidly defined entities and their profiles change over time. No previous study has investigated multiple disciplinarity (i.e. the complex interaction between disciplines, whether of a multidisciplinary or an interdisciplinary nature) at scale with quantitative methods, and the change in the profile of disciplines over time. This article explores a dataset of over 21 million articles published in 8400 academic journals between 1990 and 2019 and proposes a new scalable data-driven approach to multiple disciplinarity. This approach can be used to study the relationship between disciplines over time. By creating vector representations (embeddings) of disciplines and measuring the geometric closeness between the embeddings, the analysis shows that the similarity between disciplines has increased over time, but overall the size of their neighbourhood (the number of neighbouring disciplines) has decreased, pointing to disciplines being more similar to each other over time, while at the same time displaying increased specialisation. We interpret this as a pattern of global convergence combined with local specialisation. Our approach is also able to track the development of disciplines' profiles over time, detecting those that changed the most in the time period considered, and to treat disciplines as compositional units, where relationships can be expressed as analogy equations of the form $\text{Discipline}_1 + \text{Discipline}_2 \approx \text{Discipline}_3$. These findings can help researchers, academic institutions and organizations to better understand and react to the dynamics of scientific research, and can support the education sector in designing curricula or in the recruitment of academics and researchers.

Dactylography; Or, The Study of Finger-prints Henry Faulds,2021-05-19 In

Dactylography Or The Study of Finger prints Henry Faulds presents a pioneering examination of fingerprinting as a scientific method of identification melding meticulous observation with empirical research Faulds argues for the reliability of fingerprints as unique identifiers situating his work within the burgeoning fields of forensic science and criminology His literary style is both didactic and engaging employing case studies and real world applications to elucidate the principles of dactylography This seminal text marks a critical moment in the intersection of science and justice reflecting the late 19th century preoccupation with quantifying human identity as a means to enhance societal order Henry Faulds a Scottish physician and one of the early advocates of fingerprinting was influenced by his experiences in Japan where he first observed

the potential of fingerprints for personal identification His background in medicine and interest in anthropology and criminology drove him to develop this method as a tool against crime spurred by the inadequacies of contemporary identification techniques Faulds s career marked by both scientific inquiry and social advocacy informed his conviction that fingerprinting could revolutionize law enforcement This compelling work is essential reading for anyone interested in forensic science criminology or the evolution of identification practices Faulds s groundbreaking insights not only laid the foundations for modern forensic science but also invite readers to contemplate the implications of identity in a rapidly changing world
