Iodinated density gradient media

Molecular structure

Iodinated media are derivatives of triiodobenzoic acid and capable of forming solutions that are uniquely capable of banding any biological particle, according to its buoyant density, often under isosmotic conditions. In 1968 Bayum published his famous density barrier method for the isolation of mononuclear cells from human blood that used sodium metrizoate (see figure) and a polysaccharide. This technique received universal approval and Nygaard & Co. in Norway was the first company to introduce a ready-made medium in 1973 based on his original formula. The product is called Lymphoprep™ and more recently metrizoate has been replaced by diatrizoate (see figure).

Both metrizoate and diatrizoate are ionic

compounds which are able to interact with other charged groups on biological particles and also influence the distribution of ions across membranes, thus the development of non-ionic iodinated compounds was the next important step. Metrizamide was introduced in 1974 and Nycodenz® (iohexol) in 1982. Both of these non-ionic gradient media can form solutions of high density (>1.30 g/ml at 60% w/v): in metrizamide the carboxyl group present in metrizoic acid is linked to glucosamine, while in iohexol the carboxyl group is linked to the amine group of 3-amino-1,2-propanediol. This difference gives iohexol some advantages over metrizamide, notably its lower toxicity towards cells and autoclavability. The systematic name of iohexol is 5-(*N*-2,3 dihydroxypropyl-lactamido)-2,4,6-triiodo-*N,N'*-bis(2,3-dihydroxypropyl)isophthalamide.

The molecular structure of Nycodenz® (iohexol) is given in the figure below. Its molecular mass is 821.

M. Graham,D. Rickwood,1997-01-30 Many investigations into the structure and function of cells and tissues require the isolation of a particular membrane or subcellular component organelle This book covers all the necessary aspects from breaking up the cells homogenization via a variety of separation techniques the isolation and fractionation chapters to characterization of the separated organelles Current Catalog National Library of Medicine (U.S.),1983 First multi year cumulation covers six years 1965 70 **Centrifugal Separations in Molecular and Cell Biology** G.D. Birnie,D. Rickwood,2014-06-28 Centrifugal Separations in Molecular and Cell Biology focuses on the application of modern centrifugation technology in molecular and cell biology including the separation and fractionation of biological particles by centrifugation on the preparative and analytical scales The selection first covers the principles and practices of centrifugation and the bases of centrifugal separations Discussions focus on the basic concepts of sedimentation theory centrifugation methods designing centrifugation experiments care of centrifuges and rotors and statistical estimation of molecular parameters The book also ponders on the practical aspects of rate zonal centrifugation including gradient materials density and viscosity of glycerol solutions and resolution and gradient shape The publication examines fractionations in zonal rotors and the quantitative aspects of rate zonal centrifugation The text then reviews isopycnic centrifugation in ionic media and analytical centrifugation Topics include separation by isopycnic banding large scale preparative procedures and density gradient solutes The selection is a valuable reference for readers interested in centrifugation technology Research Methodology in Zoology P.S. Jungermann,F.C. Kauffman,R.G. Thurman,2012-12-06 The liver is an exceptionally complex and diverse organ that functions both as an exocrine and an endocrine gland It secretes bile which contains many constituents in addition to bile salts and it synthesizes and releases many substances in response to the body's demands including prohormones albumin clotting factors glucose fatty acids and various lipoproteins It has a dual blood supply providing a rich mixture of nutrients and other absorbed substances via the portal vein and oxygen rich blood via the hepatic artery This functional heterogeneity is accompanied by cellular heterogeneity The liver contains many cell types including hepatic parachymal cells Kiipffer cells Ito cells and endothelial cells The most abundant cell type the parenchymal cells are biochemically and structurally heterogeneous The cells in the oxygen rich areas of the portal triad appear more dependent on

oxidative metabolism whereas those around the central vein pericentral perivenous or centrolobular areas are more dependent upon an anaerobic mechanism Throughout this volume the latter three terms are used synonymously by various authors to indicate the five to eight layers of cells radiating from the central vein Structural and metabolic heterogeneity of hepatic parenchymal cells has been demonstrated by a variety of approaches including histochemical ultra structural and ultramicrobiochemical studies This microheterogeneity is linked to the physiological functions of the liver and its response to injurious substances

Bioanalytical Chemistry Susan R. Mikkelsen, Eduardo Cortón, 2016-02-22 A timely accessible survey of the multidisciplinary field of bioanalytical chemistry Provides an all in one approach for both beginners and experts from a broad range of backgrounds covering introductions theory advanced concepts and diverse applications for each method Each chapter progresses from basic concepts to applications involving real samples Includes three new chapters on Biomimetic Materials Lab on Chip and Analytical Methods Contains end of chapter problems and an appendix with selected answers

Pancreatic Islet Isolation Miriam Ramírez-Domínguez, 2016-09-01 Pancreatic islets make up the endocrine pancreas and they contain the only source of insulin in the body beta cells Hence access to high quality preparations of pancreatic islets is fundamental for in vitro studies and to test pre clinical applications in animal models in vivo Access to healthy human islets is also crucial to improve transplantation procedures for diabetes Given the susceptibility of pancreatic islets to the enzymatic digestion and

mechanical stress required to obtain them the isolation of islets is often considered as the delicate work of a craftsman This book which is aimed at beginners and experts alike is a survey of the current state of the art in this field and it centres on the challenges pitfalls and peculiarities of pancreatic islet isolation in the different species used in pre clinical and clinical applications It explores the similarities and differences between human islets and those from other relevant species rodents pigs and non human primates and how these influence islet isolation The ultimate goal of this book is to improve the outcome of islet isolation and transplantation in pre clinical and clinical applications
