

Consider the below graph $G(V, E)$, and let's say that we need to derive its square, which means the value of k is 2.

So the graph will result into the graph on the right.

Note that the vertices 1 and 3 are connected because there exists a path of length two or less in the original graph..

Similarly there exists paths of length two or less between $\{2, 4\}$, $\{3, 5\}$, $\{4, 1\}$, $\{5, 2\}$, hence these vertices are connected in the power graph.

This concludes that all the graphs are the first power of themselves. Which means if value of k is 1 then we get the same graph? And if the adjacency matrix of G is A then each cell (i, j) of A^1 will give you the number of paths of length 1 between i and j .

Let's take another example. Again let the value of k is 2. Consider the graph below.

The edges $\{1, 3\}$, $\{2, 3\}$, $\{3, 4\}$, $\{4, 6\}$, $\{5, 1\}$ and $\{6, 2\}$ are connected because they have a path length of 2 or less between them in the original graph.

The edges $\{1, 4\}$, $\{2, 5\}$ and $\{3, 6\}$ are not connected because the length of the path between them is three which is more than two.

Stanley,2013-06-17 Written by one of the foremost experts in the field Algebraic Combinatorics is a unique undergraduate textbook that will prepare the next generation of pure and applied mathematicians The combination

of the author's extensive knowledge of combinatorics and classical and practical tools from algebra will inspire motivated students to delve deeply into the fascinating interplay between algebra and combinatorics. Readers will be able to apply their newfound knowledge to mathematical engineering and business models. The text is primarily intended for use in a one semester advanced undergraduate course in algebraic combinatorics, enumerative combinatorics or graph theory. Prerequisites include a basic knowledge of linear algebra over a field, existence of finite fields and group theory. The topics in each chapter build on one another and include extensive problem sets as well as hints to selected exercises. Key topics include walks on graphs, cubes and the Radon transform, the Matrix Tree Theorem and the Sperner property. There are also three appendices on purely enumerative aspects of combinatorics related to the chapter material: the RSK algorithm, plane partitions and the enumeration of labeled trees. Richard Stanley is currently professor of Applied Mathematics at the Massachusetts Institute of Technology. Stanley has received several awards including the George Polya Prize in applied combinatorics, the Guggenheim Fellowship and the Leroy P. Steele Prize for mathematical exposition. Also by the author: *Combinatorics and Commutative Algebra* Second Edition, Birkhauser; *Combinatorics of Permutations*, Miklos Bona, 2004-06-25. WINNER of a CHOICE Outstanding Academic Title Award for 2006. As linear orders as elements of the symmetric group, matrices modeled by graphs, permutations are omnipresent in modern combinatorics. They are omnipresent but also multifaceted and while several excellent books explore particular aspects of the subject, no one book has covered them all. Even the classic results are scattered in various resources. *Combinatorics of Permutations* offers the first comprehensive up to date treatment of both enumerative and extremal combinatorics and looks at permutation as linear orders and as elements of the symmetric group. The author devotes two full chapters to the young but active area of pattern avoidance. He explores the quest for the Stanley Wilf conjecture and includes the recent and spectacular Marcus Tardos proof of this problem. He examines random permutations and Standard Young Tableaux and provides an overview of the very rich algebraic combinatorics of permutations. The final chapter takes an in depth look at combinatorial sorting algorithms. The author's style is relaxed, entertaining and clearly reflects his enthusiasm for the serious fun the subject holds. Filled with applications from a variety of fields and exercises that draw upon recent research results, this book serves equally well as a graduate level text and a reference for combinatorics researchers. *Handbook of Social Choice and Voting*, Jac C. Heckelman, Nicholas R. Miller, 2015-12-18. This Handbook provides an overview of interdisciplinary research related to social choice and voting that is intended for a broad audience. Expert contributors from various fields present critical summaries of the existing literature including intuitive explanations of technical terminology and well known theorems suggesting new directions for research. *Open Problems in Algebraic Combinatorics*, Christine Berkesch, Benjamin Brubaker, Gregg Musiker, Pavlo Pylyavskyy, Victor Reiner, 2024-08-21. In their preface the editors describe algebraic combinatorics as the area of combinatorics concerned with exact as opposed to approximate results and which puts emphasis on interaction with other

areas of mathematics such as algebra topology geometry and physics It is a vibrant area which saw several major developments in recent years The goal of the 2022 conference Open Problems in Algebraic Combinatorics 2022 was to provide a forum for exchanging promising new directions and ideas The current volume includes contributions coming from the talks at the conference as well as a few other contributions written specifically for this volume The articles cover the majority of topics in algebraic combinatorics with the aim of presenting recent important research results and also important open problems and conjectures encountered in this research The editors hope that this book will facilitate the exchange of ideas in algebraic combinatorics
