**Principles of Lasers** Orazio Svelto, D. C. Hanna, 2013-06-29 This book is the result of more than ten years of research and teaching in the field of quantum electronics The purpose of the book is to introduce the principles of lasers starting from elementary notions of quantum mechanics and electromagnetism Because it is an introductory book an effort has been made to make it self contained to minimize the need for reference to other works For the same reason the references have been limited whenever possible either to review papers or to papers of seminal importance The organization of the book is based on the fact that a laser can be thought of as consisting of three elements i an active material ii a pumping system and iii a suitable resonator Accordingly after an introductory chapter the next three chapters deal respectively with the interaction of radiation with matter pumping processes and the theory of passive optical resonators      *Laser Physics* Marc Eichhorn, 2014-03-16 This textbook originates from a lecture course in laser physics at the Karlsruhe School of Optics and Photonics at the Karlsruhe Institute of Technology KIT A main goal in the conception of this textbook was to describe the fundamentals of lasers in a uniform and especially lab oriented notation and formulation as well as many currently well known laser types becoming more and more important in the future It closes a gap between the measurable spectroscopic

quantities and the whole theoretical description and modeling This textbook contains not only the fundamentals and the context of laser physics in a mathematical and methodical approach important for university level studies It allows simultaneously owing to its conception and its modern notation to directly implement and use the learned matter in the practical lab work It is presented in a format suitable for everybody who wants not only to understand the fundamentals of lasers but also use modern lasers or even develop and make laser setups This book tries to limit prerequisite knowledge and fundamental understanding to a minimum and is intended for students in physics chemistry and mathematics after a bachelor degree with the intention to create as much joy and interest as seen among the participants of the corresponding lectures This university textbook describes in its first three chapters the fundamentals of lasers light matter interaction the amplifying laser medium and the laser resonator In the fourth chapter pulse generation and related techniques are presented The fifth chapter gives a closing overview on different laser types gaining importance currently and in the future It also contains a set of examples on which the theory learned in the first four chapters is applied and extended

**Laser Physics** Simon Hooker, Colin Webb, 2010-08-05 In this book the interaction of radiation and matter and the principles of laser operation are treated at a level suitable for fourth year undergraduate courses or introductory graduate courses in physics chemistry or engineering The factors which determine efficiency wavelength coverage output power and beam quality of the different classes of laser are treated both in terms of fundamental theory and practical construction aspects Details of established types of solid state semiconductor and gas lasers are examined together with the techniques that enable their output to be converted widely across the spectrum The latest advances in high power fibre lasers femtosecond lasers and X ray lasers are explained The text is liberally illustrated with more than 300 diagrams An extensive bibliography is provided together with numerical problems in each chapter Solutions are available via the web
