Dynamic Graphics Statistics Cleveland, 1988-07-08 The essential characteristic of a dynamic graphical method is the direct manipulation of elements of a graph on a computer screen which in high performance implementations the elements change virtually instantaneously on the screen This book contains a collection of papers about dynamic graphics dating from the late 1960s to 1988 Although technology has advanced considerably the fundamental ideas about basic graphical principles and data analytic goals are still relevant today

Graphs, Morphisms, and Statistical Physics Jaroslav Nešetřil, Peter Winkler, The intersection of combinatorics and statistical physics has experienced great activity in recent years This flurry of activity has been fertilized by an exchange not only of techniques but also of objectives Computer scientists interested in approximation algorithms have helped statistical physicists and discrete mathematicians overcome language problems They have found a wealth of common ground in probabilistic combinatorics Close connections between percolation and random graphs graph morphisms and hard constraint models and slow mixing and phase transition have led to new results and perspectives These connections can help in understanding typical behavior of combinatorial phenomena such as graph coloring and homomorphisms Inspired by issues and intriguing new questions surrounding the interplay of combinatorics and statistical physics a DIMACS DIMATIA workshop was held at Rutgers University These proceedings are

the outgrowth of that meeting This volume is intended for graduate students and research mathematicians interested in probabilistic graph theory and its applications
