**The Cauchy Problem** Hector O. Fattorini, 1983 This volume deals with the Cauchy or initial value problem for linear differential equations It treats in detail some of the applications of linear space methods to partial differential equations especially the equations of mathematical physics such as the Maxwell Schrödinger and Dirac equations Background material presented in the first chapter makes the book accessible to mathematicians and physicists who are not specialists in this area as well as to graduate students

**Cauchy Problem for Differential Operators with Double Characteristics** Tatsuo Nishitani, 2017-11-24 Combining geometrical and microlocal tools this monograph gives detailed proofs of many well ill posed results related to the Cauchy problem for differential operators with non effectively hyperbolic double characteristics Previously scattered over numerous different publications the results are presented from the viewpoint that the Hamilton map and the geometry of bicharacteristics completely characterizes the well ill posedness of the Cauchy problem A doubly characteristic point of a differential operator  $P$  of order  $m$  i e one where  $P_m \neq 0$  is effectively hyperbolic if the Hamilton map  $F_P$  has real non zero eigen values When the characteristics are at most double and every double characteristic is effectively hyperbolic the Cauchy problem for  $P$  can be solved for arbitrary lower order terms If there is a non effectively hyperbolic characteristic solvability requires the subprincipal symbol of  $P$  to lie between  $P_j$  and  $P_j$  where  $i, j$  are the positive imaginary eigenvalues of  $F_P$  Moreover if  $0$  is an eigenvalue of  $F_P$  with corresponding  $4 \times 4$  Jordan block the spectral structure of  $F_P$  is insufficient to determine whether the Cauchy problem is well posed and the behavior of bicharacteristics near the doubly characteristic manifold plays a crucial role

**Inverse Problems for Partial Differential Equations** Victor Isakov, 2013-06-29 This book describes the contemporary state of the theory and some numerical aspects of inverse problems in partial differential equations The topic is of substantial and growing interest for many scientists and engineers and accordingly to graduate students in these areas Mathematically these problems are relatively new and quite challenging due to the lack of conventional stability and to nonlinearity and nonconvexity Applications include recovery of inclusions from anomalies of their gravitational fields reconstruction of the interior of the human body from exterior electrical ultrasonic and magnetic measurements recovery of interior structural parameters of detail of machines and of the underground from similar data non destructive evaluation and locating flying or navigated objects from their acoustic or electromagnetic fields Currently there are hundreds of publications containing new and interesting results A purpose of the book is to collect and present many of them in a readable and informative form Rigorous proofs are presented whenever they are relatively short and can be demonstrated by quite general

mathematical techniques Also we prefer to present results that from our point of view contain fresh and promising ideas In some cases there is no complete mathematical theory so we give only available results We do not assume that a reader possesses an enormous mathematical technique In fact a moderate knowledge of partial differential equations of the Fourier transform and of basic functional analysis will suffice *The Method of Characteristics for Three-dimensional Real-gas Flows* Charles R. Strom, 1967 The method of characteristics is formulated for the computation of the supersonic flow of an inviscid reacting gas over a smooth three dimensional body Various methods of constructing networks of bicharacteristic lines are examined from the point of view of numerical stability and accuracy A new method of forming the network which consists of projecting forward along streamlines from data points on specified data planes is found to be most easily adopted to the particular requirements of nonequilibrium chemistry The general method was coded for the IBM 7090 computer and the program demonstrated for the case of an ideal gas Calculations were made for the case of an ideal gas Calculations were made for the flow about a spherical tip 15 degree half angle cone at 10 degree angle of attack and a generalized elliptical body at zero incidence Since the program yields the pressure distribution along specified streamlines it is straightforward in principle to link it to a finite rate chemistry stream tube program to treat three dimensional nonequilibrium flows Author

**Linear Multivariable Control: a Geometric Approach** W. M. Wonham, 2012-12-06 In writing this monograph my aim has been to present a geometric approach to the structural synthesis of multivariable control systems that are linear time invariant and of finite dynamic order The book is addressed to graduate students specializing in control to engineering scientists engaged in control systems research and development and to mathematicians with some previous acquaintance with control problems The present edition of this book is a revision of the preliminary version published in 1974 as a Springer Verlag Lecture Notes volume and some of the remarks to follow are repeated from the original preface The label geometric in the title is applied for several reasons First and obviously the setting is linear state space and the mathematics chiefly linear algebra in abstract geometric style The basic ideas are the familiar system concepts of controllability and observability thought of as geometric properties of distinguished state subspaces Indeed the geometry was first brought in out of revulsion against the orgy of matrix manipulation which linear control theory mainly consisted of not so long ago But secondly and of greater interest the geometric setting rather quickly suggested new methods of attacking synthesis which have proved to be intuitive and economical they are also easily reduced to matrix arithmetic as soon as you want to compute

**Calogero—Moser— Sutherland Models** Jan F. van Diejen, Luc Vinet, 2012-12-06 In the 1970s F Calogero and D Sutherland discovered that for certain potentials in one dimensional systems but for any number of particles the Schrödinger eigenvalue problem is exactly solvable Until then there was only one known nontrivial example of an exactly solvable quantum multi particle problem J Moser subsequently showed that the classical counterparts to these models is also amenable to an exact analytical approach The last decade has witnessed a true explosion of activities involving Calogero

Moser Sutherland models and these now play a role in research areas ranging from theoretical physics such as soliton theory quantum field theory string theory solvable models of statistical mechanics condensed matter physics and quantum chaos to pure mathematics such as representation theory harmonic analysis theory of special functions combinatorics of symmetric functions dynamical systems random matrix theory and complex geometry The aim of this volume is to provide an overview of the many branches into which research on CMS systems has diversified in recent years The contributions are by leading researchers from various disciplines in whose work CMS systems appear either as the topic of investigation itself or as a tool for further applications

*Mathematical Methods For Physicists* Danilo Babusci, Giuseppe Dattoli, Silvia Licciardi, Elio Sabia, 2019-10-02 The book covers different aspects of mathematical methods for Physics It is designed for graduate courses but a part of it can also be used by undergraduate students The leitmotiv of the book is the search for a common mathematical framework for a wide class of apparently disparate physical phenomena An important role within this respect is provided by a nonconventional formulation of special functions and polynomials The proposed methods simplify the understanding of the relevant technicalities and yield a unifying view to their applications in Physics as well as other branches of science The chapters are not organized through the mathematical study of specific problems in Physics rather they are suggested by the formalism itself For example it is shown how the matrix formalism is useful to treat ray Optics atomic systems evolution QED QCD and Feynman diagrams The methods presented here are simple but rigorous They allow a fairly substantive tool of analysis for a variety of topics and are useful for beginners as well as the more experienced researchers

**Use of a Characteristic Surfaces for Unsymmetrical Supersonic Flow Problems** Wolfgang E. Moeckel, 1949 Application of the method of characteristics to the linearized three dimensional equation results in a relatively simple system of difference equations that can be used to compute the supersonic flow past boundaries for which no other linearized solutions are available

**Symmetrization and Stabilization of Solutions of Nonlinear Elliptic Equations** Messoud Efendiev, 2018-10-17 This book deals with a systematic study of a dynamical system approach to investigate the symmetrization and stabilization properties of nonnegative solutions of nonlinear elliptic problems in asymptotically symmetric unbounded domains The usage of infinite dimensional dynamical systems methods for elliptic problems in unbounded domains as well as finite dimensional reduction of their dynamics requires new ideas and tools To this end both a trajectory dynamical systems approach and new Liouville type results for the solutions of some class of elliptic equations are used The work also uses symmetry and monotonicity results for nonnegative solutions in order to characterize an asymptotic profile of solutions and compares a pure elliptic partial differential equations approach and a dynamical systems approach The new results obtained will be particularly useful for mathematical biologists
