Landslide Risk Assessment E. Mark Lee, David K. C. Jones, 2004 Over the past decade there has been a gradual shift away from simply relying on engineering solutions to individual landslide problems to the use of a variety of strategies to manage the problems over a broad area Such alternative strategies include the use of building codes land use planning controls preventing water leakage early warning systems and insurance schemes This book addresses these developments and provides a multidisciplinary perspective on landslide management

Landslide Hazards, Risks, and Disasters Tim Davies, 2014-10-23 Landslides are the most costly geo hazard in the world and they re often the cause or the result of other hazards and disasters such as tsunamis earthquakes wildfires and volcanic eruptions Landslide Hazards Risks and Disasters makes a close and detailed examination of major mass movements and provides measures for more thorough and accurate monitoring prediction preparedness and prevention It takes a geoscientific approach to the topic while also discussing the impacts human induced causes such as deforestation blasting and building construction underscoring the multi disciplinary nature of the topic Contains contributions from expert geologists seismologists geophysicists and environmental scientists selected by a world renowned editorial board Presents the latest research on causality economic impacts fatality rates and landslide and problem soil preparedness and mitigation Numerous tables maps diagrams illustrations photographs and video captures of hazardous processes Discusses steps for prevention and treatment of problem soils the most expensive geo hazard in the world

Landslide Risk Assessment David Cruden, 2018-05-02 The 25 papers collected together in this volume present comprehensive coverage of all major aspects of landslide risk assessment including the risk assessment framework and methods for estimating probability of landsliding vulnerability and risk

Partnerships for Reducing Landslide Risk National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee on the Review of the National Landslide Hazards Mitigation Strategy, 2004-03-15 Landslides occur in all geographic regions of the nation in

response to a wide range of conditions and triggering processes that include storms earthquakes and human activities Landslides in the United States result in an estimated average of 25 to 50 deaths annually and cost 1 to 3 billion per year In addition to direct losses landslides also cause significant environmental damage and societal disruption Partnerships for Reducing Landslide Risk reviews the U S Geological Survey's USGS National Landslide Hazards Mitigation Strategy which was created in response to a congressional directive for a national approach to reducing losses from landslides Components of the strategy include basic research activities improved public policy measures and enhanced mitigation of landslides This report commends the USGS for creating a national approach based on partnerships with federal state local and non governmental entities and finds that the plan components are the essential elements of a national strategy Partnerships for Reducing Landslide Risk recommends that the plan should promote the use of risk analysis techniques and should play a vital role in evaluating methods setting standards and advancing procedures and guidelines for landslide hazard maps and assessments This report suggests that substantially increased funding will be required to implement a national landslide mitigation program and that as part of a 10 year program the funding mix should transition from research and guideline development to partnership based implementation of loss reduction measures
