New advances in Rehabilitation of Stroke Xiao Lu, Sheng Li, Xiquan Hu, Hua Yuan, Yue Lan, 2024-01-22 Worldwide stroke remains one of the leading causes of death and long term disability with an estimated prevalence of 2.5%. The prevalence of people living with the effects of stroke has increased because of the growing aging population. As the number of stroke survivors increases so does the demand for function rehabilitation of stroke. The goal of conventional rehabilitation is to improve residual function and restore independence but its impact is still limited. Novel therapeutic approaches remain urgent and the potential mechanisms underlying these approaches require further exploration. Therefore in this Research Topic our goals include 1 to explore novel rehabilitation approaches of stroke in both acute and chronic stages 2 to explore the potential mechanisms underlying novel rehabilitation approaches of stroke 3 to explore different situations and challenges across different countries regarding rehabilitation of stroke 4 to identify ways to further improve the quality of rehabilitation for stroke 5 to identify and remove barriers that limit patients access to appropriate rehabilitation services

Brain Informatics Peipeng Liang, Vinod Goel, Chunlei Shan, 2019-12-05 This book constitutes the refereed proceedings of the 12th International Conference on Brain Informatics BI 2019 held in Haikou China in December 2019. The 26 revised full papers were carefully reviewed and selected from 36 submissions. The papers are organized in the following topical sections: cognitive and computational foundations of brain science; human information processing systems; brain big data analysis; curation and management informatics; paradigms for brain and mental health research; and brain machine intelligence and brain inspired computing. Also included is a special session on computational social analysis for mental health.

Language in Our Brain Angela D. Friederici, 2017-11-16 A landmark account of the neurobiological basis of language arguing that species specific brain differences may be at the root of the human capacity for language. Language makes us human. It is an intrinsic part of us although we seldom think about it. Language is also an extremely complex entity with subcomponents responsible for its phonological, syntactic and semantic aspects. In this landmark work Angela Friederici offers a comprehensive account of these subcomponents and how they are integrated. Tracing the neurobiological basis of language across brain regions in humans and other primate species she argues that species specific brain differences may be at the root of the human capacity for language. Friederici shows which brain regions support the different language processes and how these brain regions are connected structurally and functionally to make language processes that take place in milliseconds possible. She finds that one particular brain structure connecting syntax relevant brain regions is present only in the mature human brain and only weakly present in other primate brains. Is this the missing link that explains humans capacity for language? Friederici describes the basic language functions and their brain

basis the language networks connecting different language related brain regions the brain basis of language acquisition during early childhood and when learning a second language proposing a neurocognitive model of the ontogeny of language and the evolution of language and underlying neural constraints She finds that it is the information exchange between the relevant brain regions supported by the white matter tract that is the crucial factor in both language development and evolution
