Photosensitive epilepsy by P M Jeavons, G F A Harding; Spastics International Medical Publications, London, 1975, 121 pages, £4.50

In this duograph the authors describe a syndrome in which epileptic seizures can be triggered by visual stimuli. The book begins with a review of earlier reports of such cases, and then goes on to describe the authors' own study of 460 photosensitive patients. Although rarely diagnosed at present, photosensitive epilepsy may occur in more than 1 in 10000 of the population. It is commoner than true petit mal, and is found most frequently among adolescents.

Readers of *Perception* will be most interested in the types of stimulus which can precipitate fits in photosensitive patients. Reports that seizures sometimes occur while patients are watching television has led to the study of flicker and pattern as relevant stimulus parameters. Jeavons and Harding systematically plotted the range of stroboscopic flash rates which would induce seizures in their patients; in some cases this range was very narrow. A fine grid pattern placed on the face of the stroboscope facilitated the induction of seizures. The effects of the stimulator were markedly reduced if one eye was closed, or if the image did not fall on the fovea. The authors found that the colour of the stimulus made very little difference. From the abnormal shapes of the visual evoked potentials recorded from the scalp, and the presence in some patients of spiking in the occipital EEG, Jeavons and Harding suggest that a failure of inhibition in the visual cortex may be the cause of the epileptic discharges.

The authors are to be congratulated for their attempt to approach the problem of photosensitive epilepsy so comprehensively. Their emphasis on the standardization of testing procedures (especially the quantification of the stimuli provided by different makes of stroboscope) is particularly welcome. On the other hand, the reading is made difficult in places by the variety of styles of writing used throughout the book, the lack of a summary at the end of most of the chapters, and the division of the (admittedly heterogeneous) sample of patients into so many groups and subgroups. Nevertheless, the book is a useful source of information, not only for practising clinicians, but also for researchers into epilepsy who seek a precise model to use in studying the mechanisms of seizure initiation, and for the many researchers in vision who are interested in the practical applications of their work.

Movements of the eyes by R H S Carpenter; Pion, London (distributed by Academic Press, London and New York), 1977, 420 pages, £13.50 (US: \$27.00)

There is an ancient proverb which says that people will bow down even to the servants of a king. The eye reigns as supreme monarch among the human sense organs, and the oculomotor system has achieved some prestige by its subservience to this master. Much of this prestige is indeed justified because the exquisite precision of localization and resolution in the sensory mechanism of the eye demands a matching precision from the system that is responsible for placing and holding it in position. But, in addition, the system controlling eye movements demands study in its own right as an exemplar of biological control systems.

Historically, World War II indirectly generated an upsurge of interest in the physiology of eye movements. The exigencies of military technology brought about the development of the theoretical analysis of automatic control systems, and new methods were evolved for handling "information" as a measurable quantity, subject to its own natural laws. The design of automatic control systems demanded of engineers the solution of the very same problems that the evolutionary process had been solving, by trial and error, in the development of biological control systems; to point a finger, to aim a gun automatically, to lock a radar beam onto a moving plane, and to direct the eyes at a moving bird, are closely analogous processes. Two features of these processes were understood only imperfectly by 19th century physicists. The one concerned the consequences

The Neurolinguistics of Bilingualism Franco Fabbro, 2013-05-24 This book introduces the reader to both neurolinguistics per se and the neuropsychological aspects of bilingualism Neurolinguistics may roughly be defined as a subset of neuropsychology namely the study of the representation and processing of language in the brain To this effect the first chapters of the book focus on the basic neuropsychology of language processing and acquisition The second half of the book addresses the issues of cerebral representation and processing of language in bi or multilingual subjects All aspects are systematically dealt with namely the definition of bilingualism an analysis of all the issues related to bilingual aphasia i e patterns of recovery of the patients various languages in diverse population an investigation of the methodologies used in the study of the neuropsychological aspects of the various linguistic functions such as comprehension production and translation and lastly the issues of cerebral lateralization and neuroanatomical localization of the numerous cortical and subcortical structures subserving the various language system components in multilingual subjects It is an excellent introduction to both the neuropsychology of language and the phenomena related to bilingualism This book will be of particular interest to

students of language therapy aphasiology applied psycholinguistics neurolinguistics and in general to students of medicine who wish to become more knowledgeable about the specific needs of patients in a multilingual society Talking the Talk Trevor A. Harley, 2017-02-02 Talking the Talk provides a comprehensive introduction to the psychology of language written for the reader with no background in the field or any prior knowledge of psychology Written in an accessible and friendly style the book answers the questions people actually have about language how do we speak listen read and learn language The book advocates an experimental approach explaining how psychologists can use experiments to build models of language processing Considering the full breadth of psycholinguistics the book covers core topics including how children acquire language how language is related to the brain and what can go wrong with it Fully updated throughout this edition also includes Additional coverage on the genetics of language Insight into potential cognitive advantages of bilingualism New content on brain imaging and neuroscience Increased emphasis on recursion and what is special about language Talking the Talk is written in an engaging style which does not hesitate to explain complex concepts It is essential reading for all undergraduate students and those new to the topic as well as the interested lay reader *Developmental Psychobiology and Developmental Neurobiology* Elliott M. Prinz, A. F. Sanders, 2012-12-06 The issue of the relationship between cognition and motor processes can be and has been raised at different levels of analysis At the neurophysiological level it refers to the interactions between afferent and efferent information At the neurological and neuropsychological level it relates to the mutual dependencies between the sensory and the motor part of the brain or more precisely between sensory and motor functions of various parts of the brain In psychology the issue under debate concerns at a molecular level the relationship between perception and movement or at a more molar level the relations between cognition and action For the title of this book we deliberately decided to combine two terms that are taken from two of these levels in order to emphasize both the multilevel structure of the issues involved and the multidisciplinary nature of the following contributions Although the term cognition has been tremendously misused in recent years at least in psychology it is still the only term available to serve as a convenient collective name for all sorts of cognitive processes and functions *Theoretical Issues in Reading Comprehension* Rand J.
