Intraoperative Monitoring Silvia Mazzali Verst, Maria Rufina Barros, Marcos Vinicius Calfat Maldaun, 2022-07-07 In recent decades the advances in and consolidation of Intraoperative Neurophysiological Monitoring IOM in several highly complex surgical areas have been undeniable. Currently all modalities of neurophysiological tests SSEP MEP EMG PEATC VEP BRAIN MAPPING ETC are performed in the operating room where they are used to provide trans operative information on the patient's neurological status in real time monitoring and to identify neural structures which are at immediate risk mapping. With the inarguably positive impact of IOM on surgical outcomes there is an increasing interest in reliable technically focused literature. This volume provides cutting edge information in the field of IOM and highlights new neurophysiological tools being used in various surgeries. The book's initial sections cover a range of topics including an anatomical overview, electrical safety and detailed technical descriptions of the neurophysiological tests used in IOM. The subsequent sections address e.g. the brain, brainstem, spinal cord, vascular and peripheral nerves, epilepsy, head and neck movement disorders and special topics. Some chapters are accompanied by videos of surgeries and IOM so that the reader will have the real sensation of having been in the operating room and will gain an overview of the key steps. Written by experts in the field of IOM, the book offers a valuable resource for both experienced and early career neurophysiologists, neurosurgeons, vascular and orthopedic surgeons and surgeons involved with pelvic procedures. Further its goal is to provide a real rapport never before attained between neurophysiologists and surgeons with a sole focus excellence in terms of the final outcome.

Novel Diagnostic and Therapeutic Strategies in the Management of Cerebral Gliomas Valeria Barresi, Maria Caffo, Giuseppe Lombardi, Letteria Minutoli, Emeline Tabouret, Herui Wang, 2024-10-29 Cerebral gliomas account for 45% of all primary central nervous system (CNS) tumors. The median survival after the initial diagnosis of glioblastoma (GBM) is only 15 months and less than 10% of patients survive three years post diagnosis. Surgical treatment followed by adjuvant therapies such as radiotherapy and chemotherapy represents the classical strategy in glioma management. The revised WHO 2016 classification now distinguishes the oligodendrogliomas with 1p19q codeletion and IDH mutation from the astrocytomas with or without IDH mutations, thereby creating homogenous and pathologically distinct subgroups. While the status of gene expression and mutations define components of GBM subtypes, it was also found that response to therapies was different for each subtype, suggesting that personalized treatment based on genomic alterations could lead to a more favorable outcome for this disease.
