Spectral Theory of Non-Self-Adjoint Two-Point Differential Operators John Locker, 2000 Develops the spectral theory of an  $n$ th order non self adjoint two point differential operator  $L$  in the complex Hilbert space  $L^2_0$  The differential operator  $L$  is determined by an  $n$ th order formal differential  $l$  and by  $n$  linearly independent boundary values  $B_1 \dots B_n$  Locker first lays the foundations of the spectral theory for closed linear operators and Fredholm operators in Hilbert spaces before developing the spectral theory of the differential operator  $L$  The book is a sequel to Functional analysis and two point differential operators 1986 Annotation copyrighted by Book News Inc Portland OR

Spectral Theory of Self-Adjoint Operators in Hilbert Space Michael Sh. Birman, M.Z. Sturm-Liouville Operators, Their Spectral Theory, and Some Applications Fritz Gesztesy, Roger Nichols, Maxim Zinchenko, 2024-09-24 This book provides a detailed treatment of the various facets of modern Sturm Liouville theory including such topics as Weyl Titchmarsh theory classical renormalized and perturbative oscillation theory boundary data maps traces and determinants for Sturm Liouville operators strongly singular Sturm Liouville differential operators generalized boundary values and Sturm Liouville operators with distributional coefficients To illustrate the theory the book develops an array of examples from Floquet theory to short range scattering theory higher order KdV trace relations elliptic and algebro geometric finite gap potentials reflectionless potentials and the Sodin Yuditskii class as well as a detailed collection of singular examples such as the Bessel generalized

Bessel and Jacobi operators A set of appendices contains background on the basics of linear operators and spectral theory in Hilbert spaces Schatten von Neumann classes of compact operators self adjoint extensions of symmetric operators including the Friedrichs and Krein von Neumann extensions boundary triplets for ODEs Krein type resolvent formulas sesquilinear forms Nevanlinna Herglotz functions and Bessel functions *Introduction to spectral theory: selfadjoint ordinary differential operators* Boris Moiseevich Levitan, Ishkhan Saribekovich Sargsyan, 1975 Presents a monograph that is devoted to the spectral theory of the Sturm Liouville operator and to the spectral theory of the Dirac system This book concerns with  $n$ th order operators that can serve as simply an introduction to this domain It includes a chapter that discusses this theory

*Spectral Theory* Nelson Dunford, 1963 **Linear Operators** Nelson Dunford, 1967 *An Introduction to Spectral Theory* Andrei Giniatouline, 2005 A brief and accessible introduction to the spectral theory of linear second order elliptic differential operators By introducing vital topics of abstract functional analysis where necessary and using clear and simple proofs the book develops an elegant presentation of the theory while integrating applications of basic real world problems involving the Laplacian Suitable for use as a self contained introduction for beginners or as a one semester student text contains some 25 examples and 60 exercises most with detailed hints **Elements of Hilbert Spaces and Operator Theory** Harkrishan Lal Vasudeva, 2017-03-27 The book presents an introduction to the geometry of Hilbert spaces and operator theory targeting graduate and senior undergraduate students of mathematics Major topics discussed in the book are inner product spaces linear operators spectral theory and special classes of operators and Banach spaces On vector spaces the structure of inner product is imposed After discussing geometry of Hilbert spaces its applications to diverse branches of mathematics have been studied Along the way are introduced orthogonal polynomials and their use in Fourier series and approximations Spectrum of an operator is the key to the understanding of the operator Properties of the spectrum of different classes of operators such as normal operators self adjoint operators unitaries isometries and compact operators have been discussed A large number of examples of operators along with their spectrum and its splitting into point spectrum continuous spectrum residual spectrum approximate point spectrum and compression spectrum have been worked out Spectral theorems for self adjoint operators and normal operators follow the spectral theorem for compact normal operators The book also discusses invariant subspaces with special attention to the Volterra operator and unbounded operators In order to make the text as accessible as possible motivation for the topics is introduced and a greater amount of explanation than is usually found in standard texts on the subject is provided The abstract theory in the book is supplemented with concrete examples It is expected that these features will help the reader get a good grasp of the topics discussed Hints and solutions to all the problems are collected at the end of the book Additional features are introduced in the book when it becomes imperative This spirit is kept alive throughout the book *Non-Self-Adjoint Schrödinger Operator with a Periodic Potential* Oktay Veliev, 2025-08-03 This book offers a comprehensive exploration of spectral theory for non self adjoint

differential operators with complex valued periodic coefficients addressing one of the most challenging problems in mathematical physics and quantum mechanics constructing spectral expansions in the absence of a general spectral theorem It examines scalar and vector Schrödinger operators including those with PT symmetric periodic optical potentials and extends these methodologies to higher order operators with periodic matrix coefficients The second edition significantly expands upon the first by introducing two new chapters that provide a complete description of the spectral theory of non self adjoint differential operators with periodic coefficients The first of these new chapters focuses on the vector case offering a detailed analysis of the spectral theory of non self adjoint Schrödinger operators with periodic matrix potentials It thoroughly examines eigenvalues eigenfunctions and spectral expansions for systems of one dimensional Schrödinger operators The second chapter develops a comprehensive spectral theory for all ordinary differential operators including higher order and vector cases with periodic coefficients It also includes a complete classification of the spectrum for PT symmetric periodic differential operators making this edition the most comprehensive treatment of these topics to date The book begins with foundational topics including spectral theory for Schrödinger operators with complex valued periodic potentials and systematically advances to specialized cases such as the Mathieu Schrödinger operator and PT symmetric periodic systems By progressively increasing the complexity it provides a unified and accessible framework for students and researchers The approaches developed here open new horizons for spectral analysis particularly in the context of optics quantum mechanics and mathematical physics
