Mathematics of Complexity and Dynamical Systems Robert A. Meyers,2011-10-05 Mathematics of Complexity and Dynamical Systems is an authoritative reference to the basic tools and concepts of complexity systems theory and dynamical systems from the perspective of pure and applied mathematics Complex systems are systems that comprise many interacting parts with the ability to generate a new quality of collective behavior through self organization e g the spontaneous formation of temporal spatial or functional structures These systems are often characterized by extreme sensitivity to initial conditions

as well as emergent behavior that are not readily predictable or even completely deterministic The more than 100 entries in this wide ranging single source work provide a comprehensive explication of the theory and applications of mathematical complexity covering ergodic theory fractals and multifractals dynamical systems perturbation theory solitons systems and control theory and related topics Mathematics of Complexity and Dynamical Systems is an essential reference for all those interested in mathematical complexity from undergraduate and graduate students up through professional researchers

Handbook of Differential Equations: Evolutionary Equations C.M. Dafermos, Eduard Feireisl, 2004-08-24 This book contains several introductory texts concerning the main directions in the theory of evolutionary partial differential equations The main objective is to present clear rigorous and in depth surveys on the most important aspects of the present theory The table of contents includes W Arendt Semigroups and evolution equations Calculus regularity and kernel estimates A Bressan The front tracking method for systems of conservation laws E DiBenedetto J M Urbano V Vespri Current issues on singular and degenerate evolution equations L Hsiao S Jiang Nonlinear hyperbolic parabolic coupled systems A Lunardi Nonlinear parabolic equations and systems D Serre L^1 stability of nonlinear waves in scalar conservation laws B Perthame Kinetic formulations of parabolic and hyperbolic PDEs from theory to numerics Proceedings of the 1981 Army Numerical Analysis and Computers Conference, 1981 *Mathematical Aspects of Nonlinear Dispersive Equations (AM-163)* Jean Bourgain, Carlos E. Kenig, Sergiu Klainerman, 2009-01-10 This collection of new and original papers on mathematical aspects of nonlinear dispersive equations includes both expository and technical papers that reflect a number of recent advances in the field The expository papers describe the state of the art and research directions The technical papers concentrate on a specific problem and the related analysis and are addressed to active researchers The book deals with many topics that have been the focus of intensive research and in several cases significant progress in recent years including hyperbolic conservation laws Schrödinger operators nonlinear Schrödinger and wave equations and the Euler and Navier Stokes equations *Computing Qualitatively Correct Approximations of Balance Laws* Laurent Gosse, 2013-03-30 Substantial effort has been drawn for years onto the development of possibly high order numerical techniques for the scalar homogeneous conservation law an equation which is strongly dissipative in L^1 thanks to shock wave formation Such a dissipation property is generally lost when considering hyperbolic systems of conservation laws or simply inhomogeneous scalar balance laws involving accretive or space dependent source terms because of complex wave interactions An overall weaker dissipation can reveal intrinsic numerical weaknesses through specific nonlinear mechanisms Hugoniot curves being deformed by local averaging steps in Godunov type schemes low order errors propagating along expanding characteristics after having hit a discontinuity exponential amplification of truncation errors in the presence of accretive source terms This book aims at presenting rigorous derivations of different sometimes called well balanced numerical schemes which succeed in reconciling high accuracy with a stronger robustness even in the aforementioned accretive contexts It is divided into two parts one

dealing with hyperbolic systems of balance laws such as arising from quasi one dimensional nozzle flow computations multiphase WKB approximation of linear Schrödinger equations or gravitational Navier Stokes systems Stability results for viscosity solutions of onedimensional balance laws are sketched The other being entirely devoted to the treatment of weakly nonlinear kinetic equations in the discrete ordinate approximation such as the ones of radiative transfer chemotaxis dynamics semiconductor conduction spray dynamics or linearized Boltzmann models Caseology is one of the main techniques used in these derivations Lagrangian techniques for filtration equations are evoked too Two dimensional methods are studied in the context of non degenerate semiconductor models

Hyperbolic Problems: Theory, Numerics and Applications Eitan Tadmor, Jian-Guo Liu, Athanasios E. Control Methods in PDE-Dynamical Systems Fabio Ancona, 2007 While rooted in controlled PDE systems this 2005 AMS IMS SIAM Summer Research Conference sought to reach out to a rather distinct yet scientifically related research community in mathematics interested in PDE based dynamical systems Indeed this community is also involved in the study of dynamical properties and asymptotic long time behavior in particular stability of PDE mixed problems It was the editors conviction that the time had become ripe and the circumstances propitious for these two mathematical communities that of PDE control and optimization theorists and that of dynamical specialists to come together in order to share recent advances and breakthroughs in their respective disciplines This conviction was further buttressed by recent discoveries that certain energy methods initially devised for control theoretic a priori estimates once combined with dynamical systems techniques yield wholly new asymptotic results on well established nonlinear PDE systems particularly hyperb These expectations are now particularly well reflected in the contributions to this volume which involve nonlinear parabolic as well as hyperbolic

equations and their attractors aero elasticity elastic systems Euler Korteweg models thin film equations Schrodinger equations beam equations etc in addition the static topics of Helmholtz and Morrey potentials are also prominently featured A special component of the present volume focuses on hyperbolic conservation laws to take advantage of recent theoretical advances with significant implications also on applied problems in all these areas the reader will find state of the art accounts as stimulating starting points for further research *Proceedings*, 1981 Order, Disorder And Criticality: Advanced Problems Of Phase Transition Theory - Volume 6 Yuriy Holovatch, 2020-06-22 This book is the sixth volume of reviews on advanced problems of phase transitions and critical phenomena with the first five volumes appearing in 2004 2007 2012 2015 and 2018 It aims to provide an overview of those aspects of criticality and related topics that have attracted much attention due to the recent contributions The six chapters discuss criticality of complex systems where the new emergent properties appear via collective behaviour of simple elements Since all complex systems involve cooperative behaviour between many interconnected components the field of phase transitions and critical phenomena provides a very natural conceptual and methodological framework for their study As for the previous volumes this book is based on the review lectures that were given in Lviv Ukraine at the Ising lectures a traditional annual workshop on phase transitions and critical phenomena which aims to bring together scientists working in the field of phase transitions with university students and those who are interested in the topic The level of presentation makes the book readable both for professionals and the students in the field On a larger scale the book may contribute to promoting and deepening studies of phase transitions and critical phenomena Modelling and Optimisation of Flows on Networks Luigi Ambrosio, Alberto Bressan, Dirk Helbing, Axel Klar, Enrique Zuazua, 2012-12-14 In recent years flows in networks have attracted the interest of many researchers from different areas e g applied mathematicians engineers physicists economists The main reason for this ubiquity is the wide and diverse range of applications such as vehicular traffic supply chains blood flow irrigation channels data networks and others This book presents an extensive set of notes by world leaders on the main mathematical techniques used to address such problems together with investigations into specific applications The main focus is on partial differential equations in networks but ordinary differential equations and optimal transport are also included Moreover the modeling is completed by analysis numerics control and optimization of flows in networks The book will be a valuable resource for every researcher or student interested in the subject
