Purohit, Mr. Vivek Kumar Bhargava, Dr. Haewon Byeon, 2024-05-18 The word artificial intelligence is a concept that is used to describe the work processes of robots that would need intelligence if they were really carried out by humans as stated by As a result the term artificial intelligence refers to the academic discipline that analyzes the behavior of intelligent problem solving systems and the creation of intelligent computer systems There are two distinct classifications that may be used to artificial intelligence The computer is merely a tool for examining cognitive processes the computer duplicates intelligence This is an example of something that is considered to be weak artificial intelligence This is an example of artificial intelligence that is not very strong The actions that are carried out by the computer are procedures that include intellectual and self learning activities This is an illustration of a powerful example of artificial intelligence Using the necessary software and programming computers are able to understand and are able to modify their own behavior depending on their prior conduct and their experience This is also possible since computers are able to learn from their mistakes In this way computers are able to develop more intelligence 4 An illustration of this would be the concept of automatic networking with other computers which leads to a major influence on scalability **Methods and Applications of Artificial Intelligence**
