

# AN EXPERIMENTAL OVERVIEW OF MESON SPECTROSCOPY DATA

Curtis A. Meyer  
*Carnegie Mellon University, Pittsburgh, PA 15213*

## Abstract

In this article, I will provide an introduction to the field of experimental meson spectroscopy. I will start with a brief overview of how we classify mesons, and determine which mesons are which. I will then give a summary of how we extract mesons properties from data, and finally overview what the current issues are in the field.

## INTRODUCTION

This article is meant as an introduction to the field of meson spectroscopy, it is not intended to be a comprehensive review of the subject. I have divided this article into four parts. Initially, I will identify what mesons are, and how we classify them. In particular, their nonet structure and how we can use mass, width and decay patterns to assign them. Next, I will review partial wave analyses, and how we use this information to extract the quantum numbers of the mesons. I will then discuss what the current issues in meson spectroscopy are, and how these issues can help us understand non-perturbative QCD. Finally, I will discuss the issues which we can address using an upgraded CEBAF with 10 to 12 GeV photons.

## MESON SPECTROSCOPY

The field of light-quark meson spectroscopy studies mesons made of  $u$ ,  $d$  and  $s$  quarks. In the quark model, a meson is built from a quark and an antiquark. Given three flavors of quarks, there are nine different quark combinations.  $SU(3)$  flavor breaks these into an octet and a singlet. The physical isoscalar states are normally mixtures of the singlet state,  $|1\rangle$ , and the isoscalar octet state,  $|8\rangle$ , (see diagram below). For the pseudo-scalar nonet, the mixing angle is measured to be  $-20^\circ$ . For  $\theta \approx 36^\circ$ , the two isoscalar states become  $|s\bar{s}\rangle$  and  $|\frac{1}{\sqrt{2}}(u\bar{u} + d\bar{d})\rangle$ . This is known
