without correct planning and the correct architecture choice it leads to a server sprawl situation where your environment houses more servers than it should based on its current and predicted requirements Although scaling out on x86 systems is a common form of scaling because of their popularity the x86 systems were originally designed as cheap computers Unfortunately the scale out on x86 can easily become a problem in terms of total cost of ownership TCO when the environment starts to increase in terms of number of physical servers The LinuxONE and IBM Z servers solve the sprawl problem caused by the scaling out of x86 servers and are an excellent choice for cloud mobile big data blockchain analytics and other workloads that require a robust and flexible environment This publication describes the advantages and disadvantages of the scaling options The audience of this publication consists of the following groups Customers IBM Business Partners and IBM consultants planning and installing Linux on IBM Z IBM Z family or x86 platform System administrators administering the Linux Systems If you are a customer considering LinuxONE and IBM Z family as a platform for your applications analytics blockchain cloud or other or a pre sales person read those publications **SUSE**
