Ian G. Scragg

Intracellular Protein Degradation:

Intracellular Protein Degradation Fergus J. Doherty, R. J. Mayer, 1992 Protein degradation is important in the control of intracellular concentrations of key regulatory enzymes and other proteins This book describes the mechanisms of intracellular protein degradation at the molecular and cell biological levels including kinetics of protein degradation lysosomes cytosolic proteases the ubiquitin pathway molecular determinants of protein half life and protein degradation in disease

Determinants of Intracellular Protein Degradation Dawn Alea Parsell, 1990 *Intracellular Protein Degradation* Mark Hochstrasser, 2009

Intracellular Protein Degradation A.J. Rivett, 1998-08-07 This volume brings together a set of reviews that provide a summary of our current knowledge of the proteolytic machinery and of the pathways of protein breakdown of prokaryotic and eukaryotic cells Intracellular protein degradation is much more than just a mechanism for the removal of incorrectly folded or damaged proteins Since many short lived proteins have important regulatory functions proteolysis makes a significant contribution to many cellular processes including cell cycle regulation and transcriptional control In addition limited proteolytic cleavage can provide a rapid and efficient mechanism of enzyme activation or inactivation in eukaryotic cells In the first chapter Maurizi provides an introduction to intracellular protein degradation describes the structure and functions of bacterial ATP dependent proteases and explores the relationship between chaperone functions and protein degradation Many of the principles also apply to eukaryotic cells although the proteases involved are often not the same Interestingly homologues of one of the bacterial proteases Ion protease have been found in mitochondria in yeast and mammals and homologues of proteasomes which are found in all eukaryotic cells see below have been discovered in some eubacteria Studies of proteolysis in yeast have contributed greatly to the elucidation of both lysosomal vacuolar and nonlysosomal proteolytic pathways in eukaryotic cells Thumm and Wolf chapter 2 describe studies that have elucidated the functions of proteasomes in nonlysosomal proteolysis and the contributions of lysosomal proteases to intracellular protein breakdown Proteins can be selected for degradation by a variety of different mechanisms The ubiquitin system is one complex and highly regulated mechanism by which eukaryotic proteins are targeted for degradation by proteasomes In chapter 3 Wilkinson reviews the components and functions of the ubiquitin system and considers some of the known substrates for this pathway which include cell cycle and transcriptional regulators The structure and functions of proteasomes and their regulatory components are described in the two subsequent chapters by Tanaka and Tanahashi and by Dubiel and Rechsteiner Proteasomes were the first known example of threonine proteases They are multisubunit complexes that in addition to being responsible for the turnover of most short lived nuclear and cytoplasmic protein are also involved in antigen processing for presentation by the MHC class I pathway Recent studies reviewed by McCracken and colleagues chapter 6 lead to the exciting conclusion that some ER associated proteins are degraded by cytosolic proteasomes Lysosomes are responsible for the degradation of long lived proteins and for the

enhanced protein degradation observed under starvation conditions In chapter 7 Knecht and colleagues review the lysosomal proteases and describe studies of the roles of lysosomes and the mechanisms for protein uptake into lysosomes Methods of measuring the relative contribution of different proteolytic systems e g ubiquitin proteasome pathway calcium dependent proteases lysosomes to muscle protein degradation and the conclusions from such studies are reviewed by Attai and Taillinder in the following chapter Finally proteases play an important role in signaling apoptosis by catalyzing the limited cleavage of enzymes Mason and Beyette review the role of the major players caspases which are both activated by and catalyze limited proteolysis and also consider the involvement of other proteolytic enzymes in this pathway leading cell death

Rapoport,T. Schewe,2014-05-09 Processing and Turnover of Proteins and Organelles in the Cell is a collection of papers that tackles the problems of post translational processes along with the dynamics of cell components The materials in the title are organized thematically The text first presents articles dealing with post translational processing such as the mode of anchoring of sucrase isomaltase to the small intestinal brush border membrane and its biosynthetic implications as well as the decay and restoring in succinate dehydrogenase The next papers discuss topics related to the selective degradation of proteins such as selective control of proteinase action in yeast cells and studies of the mechanism and selectivity of intracellular protein breakdown The final set of papers covers the turnover of organelles which includes biogenesis and turnover of peroxisomes and the effect of oxygen on the synthesis of mitochondrial proteins in *Saccharomyces cerevisiae* The book will be of great use to microbiologists and biochemists Scientists from biological science disciplines will also benefit from the text **Intracellular Protein Degradation During Diabetes and Starvation** Carlos D. Walker,1979 Alcohol and Abnormal Protein Biosynthesis Marcus A. Rothschild,Murray Oratz,Sidney S. Schreiber,2014-05-17 Alcohol and

Abnormal Protein Biosynthesis Biochemical and Clinical focuses on the methods for measuring protein metabolism and the effects of alcohol and altered protein intake as they affect the heart liver skeletal muscle and the brain Organized into six sections this book begins with an overview on malnutrition and alcoholism as well as available techniques for the study of protein synthesis Subsequent section details the adaptation of protein synthesis and transport to alcohol and malnutrition Section three discusses the skeletal and cardiac muscle protein metabolism The last three sections describe the reaction of hepatic protein synthesis to malnutrition and alcohol effects of alcohol on brain RNA metabolism and alcohol associated cardiac and hepatic disease

Principles of Animal Nutrition Guoyao Wu, 2017-11-22 Animals are biological transformers of dietary matter and energy to produce high quality foods and wools for human consumption and use Mammals birds fish and shrimp require nutrients to survive grow develop and reproduce As an interesting dynamic and challenging discipline in biological sciences animal nutrition spans an immense range from chemistry biochemistry anatomy and physiology to reproduction immunology pathology and cell biology Thus nutrition is a foundational subject in livestock poultry and fish production as well as the rearing and health of companion animals This book entitled Principles of Animal Nutrition consists of 13 chapters Recent advances in biochemistry physiology and anatomy provide the foundation to understand how nutrients are utilized by ruminants and non ruminants The text begins with an overview of the physiological and biochemical bases of animal nutrition followed by a detailed description of chemical properties of carbohydrates lipids protein and amino acids It advances to the coverage of the digestion absorption transport and metabolism of macronutrients energy vitamins and minerals in animals To integrate the basic knowledge of nutrition with practical animal feeding the book continues with discussion on nutritional requirements of animals for maintenance and production as well as the regulation of food intake by animals Finally the book closes with feed additives including those used to enhance animal growth and survival improve feed efficiency for protein production and replace feed antibiotics While the classical and modern concepts of animal nutrition are emphasized throughout the book every effort has been made to include the most recent progress in this ever expanding field so that readers in various biological disciplines can integrate biochemistry and physiology with nutrition health and disease in mammals birds and other animal species e g fish and shrimp All chapters clearly provide the essential literature related to the principles of animal nutrition which should be useful for academic researchers practitioners beginners and government policy makers This book is an excellent reference for professionals and a comprehensive textbook for senior undergraduate and graduate students in animal science biochemistry biomedicine biology food science nutrition veterinary medicine and related fields

Membrane Biogenesis and Protein Targeting W. Neupert, R. Lill, 1992-12-09 This book provides a comprehensive overview of recent developments in the fast moving field of protein transport across and into intracellular membranes The soluble and membrane bound components assisting in these processes are introduced and their functions described Besides a detailed analysis of protein translocation across the bacterial plasma membrane the mechanisms of

protein targeting within the eukaryotic cell are discussed with special focus on the transport of proteins to the endoplasmic reticulum vacuoles peroxisomes mitochondria and chloroplasts Providing stimulating hypotheses and models the book is well suited for advanced students graduate students and for newcomers to the field seeking a general yet accurate introduction to present knowledge in membrane transport of proteins
