Mollison's Blood Transfusion in Clinical Medicine Harvey G. Klein, David J. Anstee, 2013-11-14

Mollison's Blood Transfusion in Clinical Medicine is an icon in the field of transfusion and the first edition was published in 1951. The book arose from the concept of the transfusionist as both scientist and expert consultant. For many years this text has provided the primary and often the sole reference for detailed information and practical experience in blood transfusion. The book is completely revised and updated throughout to include the latest advances and developments in the field.

Blood, Plasma, and Plasma Proteins José Luis Valverde, 2006

Labile blood products and plasma derived products are very sensitive from a social viewpoint. Along with the challenges faced by all medicinal products there is an added challenge due to the lack of raw material and the social problems with regards to their acquisition. Obtaining them depends on blood and plasma donations which are insufficient. Europeans as a whole fail to even cover 40 % of their needs in plasma for fractionation. The aspiration that all donations shall be voluntary free and unpaid is an altruistic objective which reality unfortunately contradicts every day. Governments and all social Agencies should promote to the maximum its actions in order to achieve the greatest number of donation each day. Even from a humanitarian or ethical viewpoint nobody can deny a possible donor accepting incentives. This incentive discussion plus the concept of self sufficiency of countries and more are discussed in this volume.

IVIG Therapy Today Mark Ballow, 2012-12-06 It has been little more than a century since Emil von Behring and his colleagues 1890 showed that the blood of tetanus immune rabbits contained a factor that could be transferred to nonimmune animals to protect them against tetanus These observations together with the work of Paul Ehrlich started scientists on the long and complex path to our present understanding of the humoral or B cell immune system These early studies led to Nobel prize awards for von Behring 1901 and Ehrlich 1908 each of whom contributed much to our knowledge of the B cell immune system In the early 20th century it was recognized that the serum of individuals who had recently suffered an infection contained a protective humoral factor that could be transferred to a nonimmune person thereafter affording that individual protection against the infectious agent that had caused disease In 1933 McKhann and Chu reported that a placental extract containing the globulin fraction could modify measles However it was not until 1939 that Tiselius and Kabat demonstrated that the antibodies responsible for protection against these infectious disorders resided within the gammaglobulin plasma fraction In a major step forward Cohn in 1944 established a method for the fractionation and purification of this plasma gammaglobulin fraction These procedures which are based on cold ethanol precipitation of plasma produce a readily adaptable large scale fractionation procedure that is still utilized to this day in the preparation of commercial gammaglobulin
