Data Analysis And Statistical Inference

Introduction:

The research question is as follows:

Did the sex of an individual affect the highest degree obtained by an individual in the year 2000?

I'm trying to find a relationship between these two variables, whether they are dependent on each other using data anlysis and statistical inference tools.

This relationship is important to others as well as it gives us an idea about the attitude and behaviour of the society pertaining to the highest degree obtained by an individual sex in the population. In other words, did the sex of a person affect the highest degree achieved by that person in the year 2000?

Data:

I'm analyzing the GSS dataset for this research.

General Social Survey monitored the American societal change and it's complexity from the year 1972 to 2012. GSS questions cover a diverse range of issues including national spending priorities, sex, degree, crime and punishment, race relations, quality of life etc.

The cases in this survey include randomly surveyed people from America from the year 1972 to 2012 of which I'm anlyzing the cases in the year 2000.

The variables I'm using are sex and degree. They are both categorical variables. Sex contains 2 levels and degree contains 5 levels.

This is an observational study. This is a survey conducted by GSS and since we are not assigning any conditions to any control, we can conclude that it is an observational study.

The population of interest includes people surveyed in the year 2000. Since this is a random survey, we can generalize to the population but we must take into account the bias of people surveyed. The survey may not truly reflect the opinion of the general population.

This data show a co-relation between two variables. Co-relation does not imply causation. We can imply causation using an experimental study.

Exploratory data analysis:

Since my research question deals with the year 2000, I subset all the cases belonging to the year 2000 into a new data frame:

```
newdata <- gss[gss$year==2000,]
```

And I'm only using the sex and degree variable, therfore I eliminate all the other columns using subset function:

```
newdata <- newdata[,c("sex","degree")]
```

The first 10 rows of the newdata is displayed below:

```
##              sex           degree
## 38117     Male         Bachelor
## 38118 Female       High School
## 38119 Female       High School
