Trends in Levels and Effects of Persistent Toxic Substances in the Great Lakes Michael Gilbertson, Glen A. Fox, William W. Bowerman, 2012-12-06 Are the Great Lakes getting better or worse This is the question that the public scientists and managers are asking the International Joint Commission after a quarter century of cooperative action by the United States and Canadian governments to clean up the Great Lakes This volume contains papers from the workshop on Environmental Results hosted in Windsor Ontario by the Great Lakes Science Advisory Board of the International Joint Commission on September 12 and 13 1996 The Great Lakes have been through almost a century of severe pollution from the manufacture use and disposal of chemicals In the 1960s wildlife biologists started to investigate the outbreaks of reproductive failure in fish eating birds and ranch mink and to link these to exposure to organochlorine compounds Human health researchers in the 1980s and 1990s linked growth retardation behavioral anomalies and deficits in cognitive development with maternal consumption of Great Lakes fish prior to pregnancy The Great Lakes became the laboratory where the theory of endocrine disruptors was first formulated Now a group of Great Lakes scientists hosted by the International Joint Commission has compiled the story of the trends in the concentrations and effects of persistent toxic substances on wildlife and humans The technical papers review the suitability of various organisms as indicators and present the results of long term monitoring of the concentrations and of the incidence of effects The evidence shows that there was an enormous improvement in the late 1970s but that in the late 1990s there are still concentrations of some persistent toxic substances that have stubbornly remained at levels that continue to cause

toxicological effects
