Embryonic Stem Cells Kursad Turksen, 2008-02-02

It is fair to say that embryonic stem ES cells have taken their place beside the human genome project as one of the most discussed biomedical issues of the day It also seems certain that as this millennium unfolds we will see an increase in scientific and ethical debate about their potential utility in society On the scientific front it is clear that work on ES cells has already generated new possibilities and stimulated development of new strategies for increasing our understanding of cell lineages and differentiation It is not naive to think that within a decade or so our overall understanding of stem cell biology will be as revolutionized as it was when the pioneering hemopoietic stem cell studies of Till and McCulloch in Toronto captured our imaginations in 1961 With it will come better methods for ES and lineage specific stem cell identification maintenance and controlled fate selection Clearly ES cell models are already providing opportunities for the establishment of limitless sources of specific cell populations In recognition of the growing excitement and potential of ES cells as models for both the advancement of basic science and future clinical applications I felt it timely to edit this collection of protocols *Embryonic Stem Cells* in which forefront investigators would provide detailed methods for use of ES cells to study various lineages and tissue types

Liposome Methods and Protocols Subhash C. Basu,Manju Basu,2008-02-04 In vitro utilization of liposomes is now recognized as a powerful tool in many bioscience investigations and their associated clinical studies e g liposomes in drug targeting liposomes in gene transport across plasma and nuclear membranes liposomes in enzyme therapy in patients with genetic disorders However before these areas can be effectively explored many basic areas in liposome research require elucidation including a attachment of liposomes to cell surfaces b permeation of liposomes through the plasma membranes and c stability of liposomes in cell or nuclear matrices None of these areas have been exhaustively explored and liposome researchers have ample opportunities to contribute to our knowledge The aim of Liposome Methods and Protocols is to bring together a wide range of detailed laboratory protocols covering different aspects of liposome biology in order to assist researchers in those rapidly advancing medical fields mentioned earlier With this goal in mind in each protocol chapter we have detailed the materials to be used followed by a step by step protocol The Notes section of each protocol is also certain to prove particularly useful since the authors include troubleshooting tips straight from their benchtops valuable information that is seldom given in restricted methods sections of standard research journals For this reason we feel that the book will prove especially useful for all researchers in the liposome field **Biomimetics and Stem Cells** Gordana

Vunjak-Novakovic, Kursad Turksen, 2016-08-23 *Biomimetics and Stem Cells Methods and Protocols* collects a series of approaches to demonstrate the role and value of biomimetics for the better understanding of stem cell behavior and the acceleration of their application in regenerative medicine. Recent advances in tissue engineering are enabling scientists to instruct stem cells toward differentiating into the right phenotypes in the right place and at the right time. Given these advances, biomimetic environments are being designed to recapitulate in vitro the combinations of factors known to guide tissue development and regeneration in vivo and thereby help unlock the full potential of the stem cells. Written in the highly successful *Methods in Molecular Biology* series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step by step readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. *Practical and essential Biomimetics and Stem Cells Methods and Protocols* focuses on the use of biomimetic systems for stem cells in order to aid in moving this vital field of study forward. *Stem Cell Transcriptional Networks* Benjamin L. Kidder, 2014 *Stem Cell Transcriptional Networks Methods and Protocols* collects techniques used to increase our understanding of the underlying transcriptional programs of stem cells that promote self renewal and differentiation. The volume opens with a section on next generation sequencing library preparation and data analysis. Continuing with a collection of protocols on visual analysis and interpretation of large scale interaction networks, this detailed compilation features transcriptional networks in embryonic and adult stem cells, embryo culture and derivation of stem cells as well as transcriptional programs that promote self renewal, reprogramming and transdifferentiation. Written for the highly successful *Methods in Molecular Biology* series, chapters include introductions to their respective topics, lists of the necessary materials, step by step readily reproducible protocols, and tips on troubleshooting and avoiding known pitfalls. *Authoritative and practical Stem Cell Transcriptional Networks Methods and Protocols* aims to provide a key resource for biologists seeking to interrogate these vital networks. *Transgenic Mouse Methods and Protocols* Marten H. Hofker, Jan van Deursen, 2008-02-04 Marten Hofker and Jan van Deursen have assembled a multidisciplinary collection of readily reproducible methods for working with mice and particularly for generating mouse models that will enable us to better understand gene function. Described in step by step detail by highly experienced investigators, these proven techniques include new methods for conditional induced knockout and transgenic mice as well as for working with mice in such important research areas as immunology, cancer, and atherosclerosis. Such alternative strategies as random mutagenesis and viral gene transduction for studying gene function in the mouse are also presented. *MHC Protocols* Stephen H. Powis, Robert W. Vaughan, 2008-02-05 The aim of *MHC Protocols* is to document protocols that can be used for the analysis of genetic variation within the human major histocompatibility complex (MHC) HLA region. The human MHC encompasses approximately 4 million base pairs on the short arm of chromosome 6 at cytogenetic location 6p21.3. The region is divided into three subregions. The telomeric class I region contains the genes that encode the HLA class I molecules HLA A, B, and C.

The centromeric class II region contains the genes encoding the HLA class II molecules HLA DR DQ and DP. In between is the class III region originally identified because it contains genes encoding components of the complement pathway. The entire human MHC has recently been sequenced¹ and each subregion is now known to contain many other genes a number of which have immunological functions. The study of polymorphism within the MHC is well established because the region contains the highly polymorphic HLA genes. HLA polymorphism has been used extensively in solid organ and bone marrow transplantation to match donors and recipients. As a result large numbers of HLA alleles have been identified a process that has been further driven by recent interest in HLA gene diversity in ethnic populations. The extreme genetic variation in HLA genes is believed to have been driven by the evolutionary response to infectious agents but relatively few studies have analyzed associations between HLA genetic variation and infectious disease which has been difficult to demonstrate.
