Games and Full Abstraction for a Functional Metalanguage with Recursive Types Guy McCusker, 2012-12-06 This book is a minor revision of the thesis submitted in August 1996 no major changes have been made However I would like to take this opportunity to mention that since the thesis was written discoveries have been made which would allow a substantial simplification and strengthening of the results in Chapters 3 and 6 In particular it is now possible to model sums correctly in the category  $\mathbf{I}$  as well as in which means that the definability results of Chapter 6 can be stated and proved at the intensional level making them simpler and much closer in spirit to the original proofs of Abramsky Jagadeesan Malacaria Hyland Ong and Nickau 10 61 79 This also leads quite straightforwardly to an understanding of call by value languages Details of these improvements can be found in 14 73 It is also worth mentioning that progress has been made on some of the topics suggested for future research in Chapter 7 In particular fully abstract models have been found for various kinds of languages with local variables 8 13 16 and a fully complete games model of the polymorphic language System F has been constructed by Hughes 59 Guy McCusker February 1998 Acknowledgements First of all I must thank my supervisor Samson Abramsky It was he who first introduced me to game semantics and suggested avenues of research in the area this book would certainly not exist were it not for him      *Formal Methods for Real-Time and Probabilistic Systems* Jost-Pieter Katoen, 2003-05-21 This book constitutes the refereed proceedings of the Fifth International AMAST Workshop on Formal Methods for Real Time and Probabilistic Systems ARTS 99 held in Bamberg Germany in May 1999 The 17 revised full papers presented together with three invited contributions were carefully reviewed and selected from 33 submissions The papers are organized in topical sections on verification of probabilistic systems model checking for probabilistic systems semantics of probabilistic process calculi semantics of real time processes real time compilation stochastic process algebra and modeling and verification of real time systems

**Declarative Logic-Programming Components for Information Agents** Michael Fink, 2002-12-30

Inhaltsangabe Abstract At present the World Wide Web faces several problems regarding the search for specific information arising on the one hand from the vast number of information sources available and on the other hand from their intrinsic heterogeneity A promising approach for solving the complex problems emerging in this context is the use of information agents in a multi agent environment which cooperatively solve advanced information retrieval problems An intelligent information agent provides advanced capabilities resorting to some form of logical reasoning based on ad hoc knowledge about the task in question and on background knowledge of the domain suitably represented in a knowledge base In this thesis our interest is in the role which some methods from the field of declarative logic programming can play in the realization of reasoning capabilities for intelligent information agents We consider the task of updating extended logic programs ELPs since in order to ensure adaptivity an agent's knowledge base is subject to change To this end we develop update agents which follow a declarative update policy and are reimplemented in the IMPACT agent environment The proposed update agents adhere to a clear semantics and are able to deal with incomplete or inconsistent information in an appropriate way Furthermore we introduce a framework for reasoning about evolving knowledgebases which are represented as ELPs and maintained by an update policy We describe a formal model which captures various update approaches and define a logical language for expressing properties of evolving knowledge bases We further investigate these mantical properties of knowledge states with respect to reasoning In particular we describe finitary characterizations of the knowledge evolution and derive complexity results for our framework Finally we consider a particular problem of information agents namely information source selection and develop an intelligent site selection agent We use ELPs for representing relevant knowledge and for declarative query analysis and query abstraction We define syntax and semantics of declarative site selection programs making use of advanced methods from answer set programming for priority handling and quantitative reasoning A site selection component is implemented on top of the DLV KR system and its plp front end for prioritized ELPs We report experimental results for this implementation

**Principles of Model Checking** Christel Baier, Joost-Pieter Katoen, 2008-04-25 A comprehensive introduction to the foundations of model checking a fully automated technique for finding flaws in hardware and software with extensive examples and both practical and theoretical exercises Our growing dependence on increasingly complex computer and software systems necessitates the development of formalisms techniques and tools for assessing functional properties of these systems One such technique that has emerged in the last twenty years is model checking which systematically and automatically checks whether a model of a given system satisfies a desired property such as deadlock freedom invariants and request response properties This automated technique for verification and debugging has developed into a mature and widely used approach with many applications Principles of Model Checking offers a comprehensive introduction to model checking that is not only a text suitable for classroom use but also a valuable reference for researchers and practitioners in the field The book begins with the basic principles for modeling concurrent and communicating systems introduces different classes of properties including safety and liveness presents the notion of fairness and provides automata based algorithms for these properties It introduces the temporal logics LTL and CTL compares them and covers algorithms for verifying these logics discussing real time systems as well as systems subject to random phenomena Separate chapters treat such efficiency improving techniques as abstraction and symbolic manipulation The book includes an extensive set of examples most of which run through several chapters and a complete set of basic results accompanied by detailed proofs Each chapter concludes with a summary bibliographic notes and an extensive list of exercises of both practical and theoretical nature
