Advances in Plan-Based Control of Robotic Agents Michael Beetz, Leonidas Guibas, Joachim Hertzberg, Malik Ghallab, Martha E. Pollack, 2003-08-02 In recent years autonomous robots including Xavier Martha 1 Rhino 2 3 Minerva and Remote Agent have shown impressive performance in long term demonstrations In NASA's Deep Space program for example an autonomous spacecraft controller called the Remote Agent 5 has autonomously performed a scientific experiment in space At Carnegie Mellon University Xavier 6 another autonomous mobile robot navigated through an office environment for more than a year allowing people to issue navigation commands and monitor their execution via the Internet In 1998 Minerva 7 acted for 13 days as a museum tourguide in the Smithsonian Museum and led several thousand people through an exhibition These autonomous robots have in common that they rely on plan-based control in order to achieve better problem solving competence In the plan-based approach robots generate control actions by maintaining and executing a plan that is effective and has a high expected utility with respect to the robot's current goals and beliefs Plans are robot control programs that a robot can not only execute but also reason about and manipulate 4 Thus a plan-based controller is able to manage and adapt the robot's intended course of action the plan while executing it and can thereby better achieve complex and changing tasks

FM'99 - Formal Methods Jeannette M. Wing, Jim Woodcock, Jim Davies, 2003-07-31 Formal methods are coming of age Mathematical techniques and tools are now regarded as an important part of the development process in a wide range of industrial and governmental organisations A transfer of technology into the mainstream of systems development is slowly but surely taking place FM 99 the First World Congress on Formal Methods in the Development of Computing Systems is a result and a measure of this new found maturity It brings an impressive array of industrial and applications oriented papers that show how formal methods have been used to tackle real problems These proceedings are a record of the technical symposium of FM 99 alongside the papers describing applications of formal methods you will find technical reports papers and abstracts detailing new advances in formal techniques from mathematical foundations to practical tools The World Congress is the successor to the four Formal Methods Europe Symposia which in turn succeeded the four VDM Europe Symposia This session reflects an increasing openness within the international community of researchers and practitioners papers were submitted covering a wide variety of formal methods and application areas The programme committee reflects the Congress's international nature with a membership of 84 leading researchers from 38 different countries The committee was divided into 19 tracks each with its own chair to oversee the reviewing process Our

collective task was a difficult one there were 259 high quality missions from 35 different countries **Planning Based on**

Decision Theory Giacomo Della Riccia, Rudolf Kruse, Didier Dubois, Hans-J. Lenz, 2014-05-04 Planning of actions based on decision theory is a hot topic for many disciplines. Seemingly unlimited computing power, networking, integration and collaboration have meanwhile attracted the attention of fields like Machine Learning, Operations Research, Management Science and Computer Science. Software agents of e-commerce, mediators of Information Retrieval Systems and Database based Information Systems are typical new application areas. Until now planning methods were successfully applied in production, logistics, marketing, finance management and used in robots, software agents etc. It is the special feature of the book that planning is embedded into decision theory and this will give the interested reader new perspectives to follow up.

System Modelling and Optimization Jacques Henry, Jean-Pierre Yvon, 2006-04-11 This conference organized jointly by UTC and INRIA is the biennial general conference of the IFIP Technical Committee 7 System Modelling and Optimization and reflects the activity of its members and working groups. These proceedings contain a collection of papers: 82 from the more than 400 submitted as well as the plenary lectures presented at the conference. Foundations of Artificial Intelligence and Robotics Wendell H. Chun, 2024-12-24 Artificial intelligence (AI) is a complicated science that combines philosophy, cognitive psychology, neuroscience, mathematics and logic, logicism, economics, computer science, computability and software. Meanwhile, robotics is an engineering field that complements AI. There can be situations where AI can function without a robot, e.g. Turing Test, and robotics without AI, e.g. teleoperation, but in many cases each technology requires the other to exhibit a complete system having smart robots and AI being able to control its interactions, i.e. effectors with its environment. This book provides a complete history of computing, AI and robotics from its early development to state of the art technology, providing a roadmap of these complicated and constantly evolving subjects. Divided into two volumes covering the progress of symbolic logic and the explosion in learning, deep learning in natural language and perception, this first volume investigates the coming together of AI, the mind and robotics, the body and discusses the state of AI today. Key Features: Provides a complete overview of the topic of AI, starting with philosophy, psychology, neuroscience and logicism and extending to the action of the robots and AI needed for a futuristic society. Provides a holistic view of AI and touches on all the misconceptions and tangents to the technologies through taking a systematic approach. Provides a glossary of terms, list of notable people and extensive references. Provides the interconnections and history of the progress of technology for over 100 years as both the hardware (Moore's Law, GPUs) and software (i.e. generative AI) have advanced. Intended as a complete reference, this book is useful to undergraduate and postgraduate students of computing as well as the general reader. It can also be used as a textbook by course convenors. If you only had one book on AI and robotics, this set would be the first reference to acquire and learn about the theory and practice. **STACS 2000** Horst Reichel, Sophie Tison, 2007-08-03 This book constitutes the refereed proceedings of the 17th Annual Symposium on Theoretical Aspects of Computer Science (STACS 2000) held in Lille, France, in

February 2000 The 51 revised full papers presented together with the three invited papers were carefully reviewed and selected from a total of 146 submissions on the basis of some 700 reviewers reports The papers address fundamental issues from all current areas of theoretical computer science including algorithms data structures automata formal languages complexity verification logic cryptography graph theory optimization etc *The Maximum Consensus Problem* Tat-Jun Chin, David Suter, 2017-02-27 Outlier contaminated data is a fact of life in computer vision For computer vision applications to perform reliably and accurately in practical settings the processing of the input data must be conducted in a robust manner In this context the maximum consensus robust criterion plays a critical role by allowing the quantity of interest to be estimated from noisy and outlier prone visual measurements The maximum consensus problem refers to the problem of optimizing the quantity of interest according to the maximum consensus criterion This book provides an overview of the algorithms for performing this optimization The emphasis is on the basic operation or inner workings of the algorithms and on their mathematical characteristics in terms of optimality and efficiency The applicability of the techniques to common computer vision tasks is also highlighted By collecting existing techniques in a single article this book aims to trigger further developments in this theoretically interesting and practically important area
