Schied,1976 **Reproductive Endocrinology and Biology** Edward Bittar,1998-07-27 We have now reached the mid point of our editorial task of putting together the compendium Principles of Medical Biology which is supposed to be composed of twenty five modules The present single volume module on reproductive endocrinology and biology is in more than one respect a continuation of Module 10 in two volumes dealing with molecular and cellular endocrinology In addition it intersects as it should with various parts of obstetrics and gynaecology both of which are abetted by technology One has only to recall that the practical benefits of ultrasound in perinatal medicine and in vitro fertilisation are the outcome of the technological revolution in biomedicine Whether we are approaching a new era in reproductive biology following the invention of animal cloning is still hard to tell For some people it remains an article of faith that cloning of the human being is highly probable For others asexual reproduction is anathema It should surely be obvious to us all that somatic cell nuclear transfer technology SCNTT is going to be at its strongest in dealing with husbandry Whether this and several social forces will alter our modern outlook there can be little doubt As in diverse clinical and basic research so in obstetrics animals are used as a model The data thus obtained is extrapolated if valid to the mother and foetus The success of this approach is exemplified in studies carried out on sheep as a model On the whole it is also quite apparent that progress in the field of reproductive biology is to a large extent ascribable to the discovery in other disciplines of new hormones as well as the introduction of new tools and recent improvements in laboratory methods including measurement of hormones **Research Grants Index** National Institutes of Health (U.S.).
