Energy-efficient Motor Systems:

Energy-efficient Motor Systems Steven Nadel, 1991 Motors use more than half of all electricity This book outlines an approach for increasing motor and motor system efficiency through high efficiency motors optimized controls improved component sizing and repair better transmission hardware and more comprehensive monitoring and maintenance In addition to explaining technical opportunities in language understandable to non engineers the book reviews what is known about the existing motor stock and its use chronicles experience to date with drive power programs and policies and offers recommendations for future efforts Full application of the measures described can cut U S electricity demand by up to 20 percent save motor users and utilities billions of dollars reduce pollutant emissions and enhance productivity The book was written by an interdisciplinary team of engineers energy analysts and program planners who collectively have over 50 years of experience in the energy efficiency field Energy Efficiency Improvements in Electric Motors and Drives Anibal de Almeida, Paolo Bertoldi, Werner Leonhard, 2012-12-06 The reduction of energy consumption through improvements in energy efficiency has become an important goal for all countries in order to improve the efficiency of the economy to increase energy supply security and to reduce the emissions of CO and other pollutants caused by power generation 2 Electric motors use over half of all electricity consumed in developed countries Typically 60 80% of the electricity which is used in the industrial sector and about 35% of the electricity used in the commercial sector in the European Union is consumed by motors In industry a motor consumes an annual quantity of electricity which corresponds to approximately 5 times its purchase price throughout its whole life of around 12 to 20 years Motors are by far the most important type of electric load They are used in all sectors and in a wide range of applications namely the following fans compressors pumps mills winders elevators transports home appliances and office equipment etc It is their wide use that makes motor drive systems one of the main targets to achieve significant energy savings As motors are the largest users of electrical energy even small efficiency improvements will produce very large energy savings Efficient Electric Motor Systems Handbook Todd Litman, 1995 Guidelines for developing a predictive and preventive motor maintenance program are also included *Energy Efficiency Improvements in Electronic Motors and Drives* Paolo Bertoldi, Anibal T. de Almeida, Hugh Falkner, 2012-12-06 The 1997 Kyoto Conference defined CO₂ emission targets for the developed regions of the world The EU target of decreasing the emissions 8% below the 1990 level by 2010 will require a very substantial effort covering basically all activities if such a target is to be reached Energy efficient motor systems can provide one of the most important opportunities to achieve electricity savings in a cost effective way avoiding at the same time the emission of tens of millions of tons of carbon The reduction of energy consumption through improvements in energy efficiency is one of the major instruments for developed and developing countries to meet the Kyoto commitments Energy efficiency is also a key element of the European Union EU energy policy since it improves the efficiency of the economy increases energy supply security and decreases harmful emissions due to

electricity generation Electric motor systems use over half of all electricity consumed in developed countries Typically about 70% of the electricity which is used in the industrial sector and about 35% of the electricity used in the commercial sector in the EU is consumed by motor systems In industry a motor on average consumes an annual quantity of electricity which corresponds to approximately 5 times its purchase price throughout its whole life of around 12 to 20 years
