## Energy In Architecture:

**Energy-Efficient Architecture** Roberto Gonzalo, Karl J. Habermann, 2012-11-05 How is an energy efficient building created Which are the most important criteria pertaining to urban development or the conception of the floor plan What are the optimal dimensions appropriate for the building s usage but also ensuring energy efficiency Which building elements and systems are most suitable This book systematically explains all relevant criteria and parameters as regards urban development design and the subsequent construction of a sustainable building The immense potential for cutting costs by modernising the energy systems in old buildings is also demonstrated Completed projects are presented according to their usage and are analysed and evaluated in the light of the above criteria For this purpose extensive plans and technical information are used to illustrate the energy profile of each building This shows the particular importance of planning details carefully An annotated subject index concludes the volume Energy and Environment in Architecture Nick Baker, Koen Steemers, 2003-09-02 This technical guide deals with environmental issues facing every architect at the concept stage of designing a building This includes determining the energy use for lighting heating cooling and ventilation

**The Architecture of Energy** Dean Hawkes, Janet Owers, 1982 **The Hierarchy of Energy in Architecture** Ravi Srinivasan, Kiel Moe, 2015-06-12 The laws of thermodynamics and their implications for architecture have not been fully integrated into architectural design Architecture and building science too often remain constrained by linear concepts and methodologies regarding energy that occlude significant quantities and qualities of energy The Hierarchy of Energy in Architecture addresses this situation by providing a clear overview of what energy is and what architects can do with it Building on the emergy method pioneered by systems ecologist Howard T Odum the authors situate the energy practices of architecture within the hierarchies of energy and the thermodynamics of the large non equilibrium non linear energy systems that drive buildings cities the planet and universe Part of the PocketArchitecture series the book is divided into a fundamentals section which introduces key topics and the emergy methodology and an applications section which features case studies applying emergy to various architectural systems The book provides a concise but rigorous exposure to the system boundaries of the energy systems related to buildings and as such will appeal to professional architects and architecture students **Architecture and Energy** Richard G. Stein, 1977 *Convergence: An Architectural Agenda for*

*Energy* Kiel Moe, 2013-07-31 Convergence is based on the thermodynamic premise that architecture should maximize its ecological and architectural power No matter how paradoxical it might initially seem architects should maximize energy intake maximize energy use and maximize energy feedback and reinforcement This presumes that the necessary excess of architecture is in fact an architect s greatest asset when it comes to an agenda for energy not a liability But how do we start to understand the full range of eco thermodynamic principles which need to be engaged with in order to achieve this Kiel Moe explicates three factors materials energy systems and amortization When these three factors converge through design

the resulting buildings begin to perform in complex if not subtle ways By drawing on a range of architectural thermodynamic and ecological sources as well as illustrated and well designed case studies the author shows what architecture stands to gain by simultaneously maximizing the architectural and ecological power of buildings

**Architecture and Energy** William Braham, Daniel Willis, 2013-07-18 Does energy consumption influence architectural style Should more energy efficient buildings look different Can that look be used to explain or enhance their performance Architecture and Energy provides architects and architectural theorists with more durable arguments for environmental design decisions arguments addressing three different scales or aspects of contemporary construction By drawing together essays from the leading experts in the field this book engages with crucial issues in sustainable design such as The larger role of energy in forming the cultural and economic systems in which architecture is conceived constructed and evaluated The different measures and meanings of energy performance and how those measures are realized in buildings The specific ways in which energy use translates into the visible aspects of architectural style Drawing on research from the UK US Europe and Asia the book outlines the problems surrounding energy and architecture and provides the reader with a considered overview of this important topic

Energy, People, Buildings Judit Kimpian, Sofie Pelsmakers, Hattie Hartman, 2021-03-04 Energy performance feedback is an essential tool in addressing the current climate crisis However this is not simply another theoretical text about energy performance in buildings This book is for anyone who wants to better understand how energy is used in buildings and how to drive down operational energy use whether you re an architect student client building services engineer contractor building operator or other stakeholder Focusing on evidence from feedback on buildings in use it explains what it takes to get them to perform as expected as well as the reasons why they often fail Energy People Buildings draws extensively on the findings of studies UK government funded building performance evaluations and on original research into seven case studies from across the UK and abroad that have achieved exemplary energy use through building performance feedback Providing a clear roadmap to understanding aspects that impact building users comfort and satisfaction it also outlines the factors behind energy use and how to track it across the life of a project to ensure that your building performs as intended Case studies include the Everyman Theatre Liverpool Rocky Mountain Institute Innovation Center Colorado and Carrowbreck Meadow Norwich Featured architects AHMM AHR Architype Hamson Barron Smith Haworth Tompkins Henning Larsen Architects and ZGF Architects

*Energy in Architecture* Luke C. Sinopoli, 2014 The whole life process of contemporary building design and construction expends tremendous amounts of energy Through their operation and maintenance buildings consume 40% of energy expended annually in the United States In the past century economic pressures have forced a planned obsolescence upon the building industry decreasing building lifespans significantly resulting in energy loss via wasted embodied energy This leads perceptions of building design and construction to be construed as finite processes engineered for immediate economic benefit and reveals an ignorance of the power and

potential of energy systems in the function of buildings In Kiel Moe's book *Convergence: An Architectural Agenda for Energy* he states that both Architecture and energy systems are both based upon notions of surplus abundance and excess However contemporary attitudes towards energy are applied based upon contrary notions of conservation and optimization Moe argues that if based upon principles of energy Architecture can actually become more simultaneously architecturally and ecologically exuberant and vital It is time that architects actualize the mutual need for maximal power in both architecture and ecology Energy historically under the purview of sibling engineering professions owned by and aligned with the Architectural process has the ability to produce Architecture that can transcend the current mode of thinking of creating a lesser evil This thesis expands on these concepts seeks strategies and identifies existing precedents in order to develop a framework for design integrating energy system concepts into the Architectural design process The design proposal focuses upon a building application that enhances durability aligning with longer term urban and energy processes Under the anticipation of change the proposal suggests a separation between permanent and temporary elements in order minimize embodied energy waste through total building demolition The proposal suggests strategies in programming phasing use and construction to develop a building proposal that anticipates change

**Energy Accounts** Dan Willis, William Braham, Katsuhiko Muramoto, Daniel Barber, 2016-06-23 How does one tell the story of energy production use or conservation in a manner sufficiently convincing to influence policy behavior and design *Energy Accounts* explores potential answers to this question through compelling images data visualizations narratives and other examples of accounting for energy Organized into a collection containing both examples of best practices and critiques this impressive array of projects and contributors combines text and graphic material to explore different representations of energy data Including work from Kieran Timberlake SHoP AMO Lateral Office WOHA and many more the book boasts a unique graphic design which supports and

enhances its role as a valuable resource for professionals and students in architecture engineering and urban design

*Energy-efficient building design in Southeast Europe* Vladimir Jovanović, 2019-03-28 The aim of this textbook is to improve conventional building design in Southeast Europe This is done with proposing conceptual guidelines for designing energy efficient buildings for different geographic regions of Serbia The focus is on climate appropriate design of building envelopes To address sustainability economical environmental and social aspects are evaluated The body is divided into three main chapters traditional houses the existing housing stock and design patterns for future buildings The conclusions and the methodology can be applied in the rest of Southeast Europe since Serbia has a unique position in the middle of the region covering different geographical areas that spread far out of Serbia's borders *Hawaiian Design* Kent Royle, Cliff

Terry, 1993-07 Presents seven strategies for energy efficient architectural design in Hawaii orientation and building form solar control daylighting natural ventilation landscaping building systems and material selection and equipment efficiency Provides architects with practical design guidelines to serve as a basis for decision making during the conceptual and schematic stages of a project Drawings graphs and photos Energy in Architecture John R. Goulding, J. Owen Lewis, T. C.

Steeners, 1992 A detailed design guide to energy efficient passive solar architecture drawing together essential information from leading European practitioners and world experts **Architectural Energy Efficiency** Nasrollahi,

Farshad, 2013-06-14 Energy saving in buildings through cost and energy intensive measures such as the application of additional building materials and technologies is only possible with a great consumption of resources and CO<sub>2</sub> emissions for their production For low energy buildings the investment costs including user costs and governmental subsidies are generally high and construction is not always economically viable in consideration of the national capital in the present economic conditions of most countries For these reasons it is first of all necessary to apply cost and resource efficient measures to save energy in buildings and then make use of additional cost and energy intensive measures by improving the thermal envelope the HVAC system or by installing energy generating systems One of the most cost effective and ecological methods of energy saving in buildings is the reduction of energy requirements through climate responsive architecture Due to the fact that energy saving through the optimization of architecture is not only cost neutral resource efficient and carbon neutral but also has a very high energy saving potential the first and most important strategy to save energy should be an optimized and climate responsive design Energy saving through optimized architectural design is economically and ecologically sustainable The development of building simulation science in the last decades has made it easier to study the energy performance of buildings Tools have made it possible to predict the complex behavior of buildings regarding the climate Except for the comparison of different building typologies to find the most efficient there are no other methods to achieve energy savings through the architectural design which can be applied by a variety of building types and climates Therefore in order to encourage the optimization of architectural design it is necessary to improve these methods which

represent strategies to significantly reduce the energy demand of buildings Architectural Energy Efficiency is a parametric method which separately studies the effects of various energy related architectural factors on the energy demand of buildings by using dynamic energy simulations to find the from an energy efficiency point of view optimum value for each of these The architectural factors include orientation building elongation building form opening ratio in different orientations sun shading natural ventilation etc The research process that led to the formulation of the Architectural Energy Efficiency method is based on a series of simulations carried out by a dynamic simulation software tool DesignBuilder to calculate the energy demands of a building with different variants for a single architectural feature The aim of the simulations is to find an optimum set of energy related variables that result in the best and most efficient energy performance for a specific building type and climate This method of efficiency illustrates the effects different architectural features have on the various energy demands of buildings The criteria are derived from the application of this method for a specific building occupation and climate and can be applied in the design process of buildings which leads to improvements of the energy performance and a reduction of resource consumption As the architectural design affects the heating and cooling as well as the lighting energy demands of buildings the optimum value of each factor must be based on these three aspects The heating cooling and lighting energy demands of buildings all behave very differently Therefore these three energy demands together i e the sum of heating cooling and lighting energy must also be applied as a criterion to study the building energy performance and find the optimum value for each architectural feature The criteria for selecting the best variant can not only be based on the total energy demand but should also consider the primary energy demand the CO<sub>2</sub> emissions energy costs for heating cooling and lighting life cycle costs etc The application of these findings to the architectural design of buildings minimizes the energy demand the CO<sub>2</sub> emissions and energy costs of the building does not however affect the initial building costs The advantages of energy saving through optimizing the architectural design are not only the improvement of the building s energy performance but also the fact that the energy saving is cost and resource efficient This means that the energy demand of a building will decrease without increasing the investment costs of the building and without consuming any resources and energy for the production of additional building materials The cost and resource efficiency contributes towards the economic and ecological sustainability of a building during the full life cycle

*Energy Modeling in Architectural Design* Timothy L. Hemsath, Kaveh Alagheh Bandhosseini, 2017-07-06 Energy Modeling in Architectural Design demonstrates how design elements can lead to energy savings to help you reduce the energy footprint of your buildings In addition to identifying climate opportunities you ll also learn fundamental passive design elements for software agnostic energy modeling of your projects from conception Using parametric models and testing each element during design will lead you to create beautiful and high performance buildings Illustrated with more than 100 color images this book also includes a pattern guide for high performance buildings discusses energy and daylighting optimization and has a glossary for easy reference [Architecture](#)

Cettina Gallo, Marco Sala, A. A. M. Sayigh, 1998 *Architecture Comfort and Energy* addresses the architecture energy combination and its relationship to human comfort and the environment. This important work examines thermal comfort, low energy architecture, dealing with various criteria for comfort in different parts of the world. It also explores how previous generations lived in harsh climates and without abundant sources of energy yet designed and built appropriate dwellings providing both comfort and harmony with the environment. *Architecture Comfort and Energy* makes essential reading for architectural students, building technologists, solar energy scientists, especially solar energy architects, energy experts, and urban town planners. Its environmental approach provides a well rounded perspective on architecture, the environment, and the use of appropriate technologies to reduce energy consumption and maximise human comfort.

**101 Rules of Thumb for Low Energy Architecture** Huw Heywood, 2019-07-25 *101 Rules of Thumb* sets out the essential elements of low energy architecture in a fresh intuitive way. In an area where ever changing technology and complex legislation can cloud the designer's thought processes, this book encourages the designer to think clearly and intuitively about the fundamentals of low energy buildings. With reliable simple rules of thumb that will provide new ideas and refresh the designer's palette, each page focuses on a single piece of advice or guidance along with a clear hand drawn illustration, while there are also plenty of tips and more detailed information for those who wish to dig deeper. The emphasis is on passive low energy principles and the rules of thumb cover all the design fundamentals from site and location to orientation and form, peppered with some which will help the designer to think outside the box about the design process itself.

Form Follows Energy Brian Cody, 2017 *Architecture is energy*. Lines drawn on paper to represent architectural intentions also imply decades and sometimes centuries of associated energy and material flows. *Form Follows Energy* is about the relationship between energy and the form of our built environment. It examines the optimisation of energy flows in building and urban design and the implications for form and configuration. It speaks to both architectural and engineering audiences and offers for the first time a truly interdisciplinary overview on the subject, explaining the complex relationships between energy and architecture in an easy to follow manner and using simple diagrams to show how energy design strategies can be used to maximize the energy performance of our built environment while at the same time leading to new aesthetic qualities and radically new forms in architecture and urban design. Case studies are used to illustrate the theory. The book's philosophy is based on the guiding principles underlying nearly 30 years work in practice, research and teaching. It is relatively easy to make something simple seem complicated. To make a complex topic seem simple and easily understandable is far more of a challenge and this is the aim of this book.

*Passive and Low Energy Architecture* Simos Yannas, Arthur Bowen, 2013-10-22 *Passive and Low Energy Architecture* contains the proceedings of the Second International PLEA Conference held in Crete, Greece on June 28 to July 1 1983. The book is organized into four parts as the topics of the conference. The first part brings together papers dealing with case studies of individual buildings or groups of buildings completed or to be built and of community planning. The case

studies cover examples from 13 countries in Europe North and Latin America North Africa the Middle East and Asia The second part contains papers on experimental work and technical developments with passive and low energy systems and components The third section focuses on the ill defined but crucial to designers area of design aids The fourth section centers on implementation and management of these energy systems including topics of international programs education and training of design professionals The book will be useful to energy conscious designers architects engineers and planners in this field of interest
