## Generalized Lr Parsing:

*Generalized LR Parsing* Masaru Tomita, 1991-08-31 The Generalized LR parsing algorithm some call it Tomita's algorithm was originally developed in 1985 as a part of my Ph D thesis at Carnegie Mellon University When I was a graduate student at CMU I tried to build a couple of natural language systems based on existing parsing methods Their parsing speed however always bothered me I sometimes wondered whether it was ever possible to build a natural language parser that could parse reasonably long sentences in a reasonable time without help from large mainframe machines At the same time I was always amazed by the speed of programming language compilers because they can parse very long sentences i.e. programs very quickly even on workstations There are two reasons First programming languages are considerably simpler than natural languages And secondly they have very efficient parsing methods most notably LR The LR parsing algorithm first precompiles a grammar into an LR parsing table and at the actual parsing time it performs shift reduce parsing guided deterministically by the parsing table So the key to the LR efficiency is the grammar precompilation something that had never been tried for natural languages in 1985 Of course there was a good reason why LR had never been applied for natural languages it was simply impossible If your context free grammar is sufficiently more complex than programming languages its LR parsing table will have multiple actions and deterministic parsing will be no longer possible

**Generalized LR Parsing for General Context-free Grammars** J. Rekers, 1991 Abstract Which methods for parser generation and parsing are best suited for an interactive development system of syntax definitions In this chapter we argue that a Generalized LR parsing algorithm is the best choice We present an enhanced version of Tomita's GLR algorithm and compare its efficiency with two competitors YACC and Earley's algorithm

**Drit Parser: a Generalized LR Parsing Algorithm Using Dot Reverse Item** Shin Sedai Konpyūta Gijutsu Kaihatsu Kikō (Japan), H. Tanaka, K. G. Suresh, H. Numazaki, 1992 [Drit parser, a generalized LR parsing algorithm using dot reverse system](#) Hozumi Tanaka, Hiroaki Numazaki, K. G. Suresh, 1992

[Implementation and Evaluation of Yet Another Generalized LR Parsing Algorithm](#) K. G. Suresh, Shin Sedai Konpyūta Gijutsu Kaihatsu Kikō (Japan), Hozumi Tanaka, 1992 Abstract This paper presents an implementation and evaluation of our new generalized LR parsing algorithm called Yet Another Generalized LR parsing algorithm YAGLR In its original version YAGLR uses graph structured stack GSS whereas in the preliminary implementation we use tree structured stack trss The merge operation of stack in our algorithm is deeper than top nodes and is effective Hence the parsing time and the reduction in memory space are remarkable Due to effective merge operations even when using trss we retain packed nature of GSS and thus not causing heavy loss of memory space Through reduce actions YAGLR creates items called drit which are symmetrically different from Earley's item The advantages in creating drit are realized Through our implementation we practically prove that for a context free grammar with reasonable size and complexity YAGLR's parsing time is in the order of  $n^3$  where  $n$  is the length of an input sentence We conclude that YAGLR has the advantages of both Earley's and Tomita's

algorithm     *Drit Parser* Hozumi Tanaka,Hiroake Numazaki,1992 Abstract We have developed a new generalized LR parser called Drit parser The parsing algorithm is based on Kipps recognition algorithm but it creates the parsing results as a set of dot reverse items drits The structure of drits is symmetric to the one of Earley s items It is possible to form parsing trees from a set of drits created after the completion of parsing This makes Kipps recognition algorithm a practical CFG parser In order to build a Drit parser some modifications in the original version of Kipps recognition algorithm are required The time and space complexity of Drit parser is in the order of  $n^3$  and  $n^2$  respectively since Drit parser is based on Kipps recognition algorithm We will conclude that Drit parser has both the advantages of Earley s and Tomita s parsing algorithm

**Generalized LR Parsing for Speech Understanding** Hiroaki Saito,1992 To recover these cases the gap filling technique is introduced The GLR parser with the gap filling function puts a fake nonterminal symbol at the noisy portion That nonterminal is resolved for example by re utterance of that portion efficiently by using the previous parse record This gap filling technique enhances the robustness of the GLR parsing significantly A Japanese to English speech translation system using the GLR phoneme parser was built as a practical speech understanding system This system was the first speech to speech translator in the world     *Scannerless Generalized-LR Parsing* Eelco Visser,1997     **Readings in Speech**
