

TYPES OF MEMORY

Analyzes and determines whether information needs to be sent to long term memory or discarded
"Is it important to me?" "Do I need to remember this information?" Examples: calculating change, ordering food from a menu.

Typically 10-15 seconds, but can be up to as long as one minute
Requires conscious effort to retain information in long-term memory, which is done by mental repetition, or more effectively, by giving it a meaning or associating it with other previously acquired knowledge. Example: recalling the color of car that passed by a few seconds ago, or remembering a phone number to write it down.

Lasts a few seconds.
Examples include:
Visual: Seeing a white Camry brings back memories of your first car.
Auditory: Hearing a song brings back memories of where you first heard it.
Tactile: Feeling sand reminds you of family vacations to the beach.
Smell: Smelling a perfume brings back memories of your grandmother.
Taste: Tasting a recipe reminds you of family dinners at Thanksgiving.

Explicit (declarative) memory: Conscious/deliberate
• **Semantic memory:** General knowledge or facts about the world
Examples: the knowledge that grass is green, recalling the capital of the United States, remembering what a...
• **Episodic memory:** Personal, autobiographical recollections of events, places, associated emotions, and other context
Examples: reminiscing about your first kiss, recalling your first job
Implicit memory: Acquired and used unconsciously; all
• **Procedural memory:** automatic recollection of skills and habits
Examples: Remembering how to tie a knot, climb stairs, play the guitar
This is often long-term and referred to as...

Human Memory Gabriel A. Radvansky, 2017-03-13

This book provides a complete survey of research and theory on human memory in three major sections. A background section covers issues of the history of memory and basic neuroscience and methodology. A core topics section discusses sensory registers, mechanisms of forgetting, and short-term working, nondeclarative, episodic, and semantic memory. Finally, a special topics section includes formal models of memory, memory for space and time, autobiographical memory, memory and reality, and more. Throughout, the author weaves applications from psychology, medicine, law, and education to show the usefulness of the concepts in everyday life and multiple career paths. Opportunities for students to explore the assessment of memory in laboratory-based settings are also provided. Chapters can be covered in any order, providing instructors with the utmost flexibility in course assignments, and each one includes an overview, key terms, Stop and Review, synopsis, Try it Out, exercises, Improving Your Memory, and Study in Depth boxes, study questions, and Putting It All Together and Explore More sections. It can also be used for more general cognitive psychology and cognitive science courses. New to this edition: Now in full color. More tables, graphs, and photos to help students visualize concepts. Improving Your Memory boxes highlight the practical aspects of memory. Study in Depth boxes review the steps of how results were constructed. The latest memory research on the testing effect, the influences of sleep, memory reconsolidation, childhood memory, the default mode network, neurogenesis, and more. Greater coverage of neuroscience, fMRIs, and other recent advances such as NIRS and pupillometry. Human Memory and Amnesia (PLE: Memory) Laird S.

Cermak, 2014-05-09. Originally published in 1982, this book brings together two areas of research previously studied in parallel with little interaction, particularly in the US: normal memory processing and the amnesic syndrome. When trying to document the relationship between the two, it became apparent that there was much crossover and duplication of effort in a number of areas: whether long-term memory and short-term memory truly represent independent storage systems or are simply points on a continuum; trying to determine the primary locus of variables influencing the rate at which information is lost during retention; whether episodic memory and semantic memory represent two different storage systems or are simply artifacts produced by different kinds of query to a single memory system; and finally, whether visual and verbal memory are independent. It was written following a meeting in 1979 by a small group of investigators brought together to explore this commonality and to share data and theory, thus beginning the promise of a bright future of interdisciplinary interaction in

 series Human Brain Function Assessment and Rehabilitation we cover the area of how brain function is assessed with
 behavioral or neuropsychological instruments These assessments are typically conducted by clinical neuropsychologists or
 behavioral neurologists and so we made an effort to present the somewhat differing approaches to these two related
 disciplines Clinical neuropsychologists are psychologists who typically utilize standardized tests while behavioral
 neurologists are physicians who generally assess brain function as part of the clinical neurological evaluation Both
 approaches have much to offer The basic assumption of neuropsychological assessment is that the brain is the organ of
 behavior and therefore the condition of the brain may be evaluated with behavioral measures Neuropsychological tests are
 those measures found by research to be particularly sensitive to alterations in brain function An adequate
 neuropsychological test is a procedure that can be related to some objective measure of alteration in brain function Over the
 years these objective measures have changed but generally involve documentation through direct observation of brain tissue
 or through histological pathological neuroimaging or other laboratory procedures The methods described in the first two
 volumes of this series describe the neuroimaging procedures that are often used in the validation of neuropsychological tests

Communication Disorders Following Traumatic Brain Injury Skye McDonald,Chris Code,Leanne
 Togher,2016-05-06 There are very few books available which are concerned with the unique communication problems that
 can come with traumatic brain injury TBI In recent years there has emerged a realisation that these difficulties in
 communication are closely tied to the cognitive behavioural and social problems observed following traumatic brain injury
 This is changing the way people with TBI are assessed and is generating new approaches to rehabilitation This volume will
 be of interest to psychologists speech pathologists and therapists and linguists Clinicians and researchers working with

people with traumatic brain injury and their students will find it a comprehensive source of contemporary approaches to characterising the communication problems of people with TBI and for planning rehabilitation

The Processing of Memories (PLE: Memory) Norman E. Spear, 2014-05-09 Originally published in 1978 this volume contains the evidence that is most crucial for our understanding the processes of forgetting and retention Organized in terms of problem areas and issues that are particularly pertinent to understanding these processes the book deals with both animal and human studies The author begins by defining the topic and reviewing its historical development A theoretical orientation follows and then the author begins to address the major factors that determine what is and what is not remembered Although we cannot yet specify the principles from which we can predict when an episode once learned will be remembered well or forgotten entirely the author demonstrates that such principles are not that far away He considers the issues that must be resolved before such principles are established and in the course of doing so covers the major research on why we remember events and why they are forgotten
