Intelligent Agents for Telecommunications Applications Sahin Albayrak, 1998 Intelligent agent and distributed AI DAI approaches attach specific conditions to cooperative exchanges between intelligent systems that go far beyond simple functional interoperability Ideally systems that pursue local or global goals coordinate their actions share knowledge and resolve conflicts during their interactions within groups of similar or dissimilar agents can be viewed as cooperative coarse grained systems The infrastructure of telecommunications is a world in transition There are a number of trends that contribute to this convergence of traditional telephony and data network worlds blurring of boundaries between public and private networks complementary evolution of wireline wireless and cable network infrastructures the emergence of integrated broadband multimedia networks and of course the information superhighway Up to now despite the effort that has gone into this area the field of intelligent agents research has not yet led to many fielded systems Telecommunications applications pose strong requirements to agents such as reliability real time performance openness security management and

other integrated management and mobility In order to fulfil their promise intelligent agents need to be fully dependable and typically require an integrated set of capabilities This is the challenge that exists for intelligent agents technology in this application domain

Intelligent Quality Systems Duc T. Pham, Ercan Oztemel, 2012-12-06 Although the term quality does not have a precise and universally accepted definition its meaning is generally well understood quality is what makes the difference between success and failure in a competitive world Given the importance of quality there is a need for effective quality systems to ensure that the highest quality is achieved within given constraints on human material or financial resources This book discusses Intelligent Quality Systems that is quality systems employing techniques from the field of Artificial Intelligence AI The book focuses on two popular AI techniques expert or knowledge based systems and neural networks Expert systems encapsulate human expertise for solving difficult problems Neural networks have the ability to learn problem solving from examples The aim of the book is to illustrate applications of these techniques to the design and operation of effective quality systems The book comprises 8 chapters Chapter 1 provides an introduction to quality control and a general discussion of possible AI based quality systems Chapter 2 gives technical information on the key AI techniques of expert systems and neural networks The use of these techniques singly and in a combined hybrid form to realise intelligent Statistical Process Control SPC systems for quality improvement is the subject of Chapters 3 5 Chapter 6 covers experimental design and the Taguchi method which is an effective technique for designing quality into a product or process The application of expert systems and neural networks to facilitate experimental design is described in this chapter

Logical Foundations for Rule-Based Systems Antoni Ligeza, 2006-01-10 The book presents logical foundations for rule based systems An attempt has been made to provide an in depth discussion of logical and other aspects of such systems including languages for knowledge representation inference mechanisms inference control design and verification The ultimate goal was to provide a deeper theoretical insight into the nature of rule based systems and put together the most complete presentation including details so frequently skipped in typical textbooks The book may be useful to a potentially wide audience but it is aimed at providing specific knowledge for graduate post graduate and Ph D students as well as knowledge engineers and research workers involved in the domain of AI It also constitutes a summary of the Author's research and experience gathered through several years of his research work

Foundations for the Web of Information and Services Dieter Fensel, 2011-06-21 In the mid 1990s Tim Berners Lee had the idea of developing the World Wide Web into a Semantic Web a web of information that could be interpreted by machines in order to allow the automatic exploitation of data which until then had to be done by humans manually One of the first people to research topics related to the Semantic Web was Professor Rudi Studer From the beginning Rudi drove projects like ONTOBROKER and On to Knowledge which later resulted in W3C standards such as RDF and OWL By the late 1990s Rudi had established a research group at the University of Karlsruhe which later became the nucleus and breeding ground for Semantic Web research and many of today's well known

research groups were either founded by his disciples or benefited from close cooperation with this think tank In this book published in celebration of Rudi's 60th birthday many of his colleagues look back on the main research results achieved during the last 20 years Under the editorship of Dieter Fensel once one of Rudi's early PhD students an impressive list of contributors and contributions has been collected covering areas like Knowledge Management Ontology Engineering Service Management and Semantic Search Overall this book provides an excellent overview of the state of the art in Semantic Web research by combining historical roots with the latest results which may finally make the dream of a Web of knowledge software and services come true
