Animal Biomarkers as Pollution Indicators David B. Peakall, 2012-12-06 Ecotoxicology is a relatively new scientific discipline Indeed it might be argued that it is only during the last 5 10 years that it has come to merit being regarded as a true science rather than a collection of procedures for protecting the environment through management and monitoring of pollutant discharges into the environment The term ecotoxicology was first coined in the late sixties by Prof Truhaut a toxicologist who had the vision to recognize the importance of investigating the fate and effects of chemicals in ecosystems At that time ecotoxicology was considered a sub discipline of medical toxicology Subsequently several attempts have been made to portray ecotoxicology in a more realistic light Notably both F Moriarty 1988 and F Ramade 1987 emphasized in their books the broad basis of ecotoxicology encompassing chemical and radiation effects on all components of ecosystems In doing so they and others have shifted concern from direct chemical toxicity to man to the far more subtle effects that pollutant chemicals exert on natural biota Such effects potentially threaten the existence of all life on Earth Although I have identified the sixties as the era when ecotoxicology was first conceived as a coherent subject area it is important to acknowledge that studies that would now be regarded as ecotoxicological are much older Wherever people s ingenuity has led them to change the face of nature significantly it has not escaped them that a number of biological consequences often unfavourable ensue

Chemical Induction of Cancer Joseph C. Arcos, Mary F. Argus, Yin-tak Woo, 2012-12-06 In the approach to the analysis of disease including of course cancer two major thrusts may be distinguished These may be referred to in

shorthand as agents and processes the causative agents chemical microbial physical environmental and psychosocial and the organismic processes initiated and furthered by the agents culminating in observable pathology at the macromolecular cytological histological organ function locomotor and behavioral levels The past 25 years since the appearance of the first volume of the predecessor series 1 authored by the Editors of this present volume have seen an impressive number of studies on chemicals and other agents as etiologic factors in the induction of cancer The major emphasis has been on the discovery of many chemical carcinogens of widely different structures their metabolism by various tissues and cells and in turn their molecular biochemical effects on the cells This rapidly expanded body of information as effectively covered in the predecessor volumes is an excellent entree to the second half of the overall problem of chemical carcinogenesis the processes The active agents trigger a large array of molecular biochemical alterations to which the target cells target tissues and target organisms respond in many select and common ways This second major aspect of the induction of cancer by chemicals and by other agents the sequence of cellular and tissue changes clearly relevant to cancer remains the challenge for the future
