Himalayan Glaciers National Research Council, Division of Behavioral and Social Sciences and Education, Committee on Population, Division on Earth and Life Studies, Water Science and Technology Board, Board on Atmospheric Studies and Climate, Committee on Himalayan Glaciers, Hydrology, Climate Change, and Implications for Water Security, 2012-12-29 Scientific evidence shows that most glaciers in South Asia's Hindu Kush Himalayan region are retreating but the consequences for the region s water supply are unclear this report finds The Hindu Kush Himalayan region is the location of several of Asia's great river systems which provide water for drinking irrigation and other uses for about 1.5 billion people Recent studies show that at lower elevations glacial retreat is unlikely to cause significant changes in water availability over the next several decades but other factors including groundwater depletion and increasing human water use could have a greater impact Higher elevation areas could experience altered water flow in some river basins if current rates of glacial retreat continue but shifts in the location intensity and variability of rain and snow due to climate change will likely have a greater impact on regional water supplies Himalayan Glaciers Climate Change Water Resources and Water Security makes recommendations and sets guidelines for the future of climate change and water security in the Himalayan Region This report emphasizes that social changes such as changing patterns of water use and water management decisions are likely to have at least as much of an impact on water demand as environmental factors do on water supply Water scarcity will likely affect the rural and urban poor most severely as these groups have the least capacity to move to new locations as needed It is predicted that the region will become increasingly urbanized as cities expand to absorb migrants in search of economic opportunities As living standards and populations rise water use will likely increase for example as more people have diets rich in meat more water will be needed for agricultural use The effects of future climate change could further exacerbate

water stress Himalayan Glaciers Climate Change Water Resources and Water Security explains that changes in the availability of water resources could play an increasing role in political tensions especially if existing water management institutions do not better account for the social economic and ecological complexities of the region To effectively respond to the effects of climate change water management systems will need to take into account the social economic and ecological complexities of the region This means it will be important to expand research and monitoring programs to gather more detailed consistent and accurate data on demographics water supply demand and scarcity Himalava: Dynamics of a Giant, Geodynamic Setting of the Himalayan Range Rodolphe Cattin, Jean-Luc Epard, 2023-07-21 The Himalaya is well known as the largest and highest mountain belt on Earth Advances in geoscience over the past few decades have revealed a complex picture of the dynamics of this giant opening up questions about the initial stages of Himalayan building lateral variations in its structures variations in tectonic forcing tectonic climate coupling and assessments of the natural hazards affecting this area In this three volume book we present the current knowledge on the building and present day behavior of the Himalayan range The objective is not to be exhaustive but to provide some key elements used by researchers to unravel the many processes acting in the Himalayan dynamics Mountain environments are at the forefront of climate change with glacier retreat landslides flash floods and water availability Understanding the delicate balance that controls the dynamics of the Himalayan giant is now more than ever a major challenge for the scientific community Himalaya: Dynamics of a Giant, Tectonic Units and Structure of the Himalaya Rodolphe Cattin, Jean-Luc Epard, 2023-07-21 The Himalaya is well known as the largest and highest mountain belt on Earth Advances in geoscience over the past few decades have revealed a complex picture of the dynamics of this giant opening up questions about the initial stages of Himalayan building lateral variations in its structures variations in tectonic forcing tectonic climate coupling and assessments of the natural hazards affecting this area In this three volume book we present the current knowledge on the building and present day behavior of the Himalayan range The objective is not to be exhaustive but to provide some key elements used by researchers to unravel the many processes acting in the Himalayan dynamics Mountain environments are at the forefront of climate change with glacier retreat landslides flash floods and water availability Understanding the delicate balance that controls the dynamics of the Himalayan giant is now more than ever a major challenge for the scientific community Pentagon's South Asia Defence and Strategic Year Book 2010 Col.
