Hip Arthroscopy:

Principles of Hip Arthroscopy Shane J. Nho, Joshua D. Harris, Jaimo Ahn, 2017-08-16 The field of arthroscopy originating from Denmark in 1912 has rapidly evolved to diagnose and treat a wide range of musculoskeletal pathologies. Although around for sometime arthroscopy in the field of orthopedics has traditionally focused on the knee shoulder or elbow as arthroscopy of the hip is technically challenging the deep structures of the hip including neurovascular bundles require specialized training and equipment to access. However with advances in surgical techniques hip arthroscopy has become increasingly popular given its ability to treat pathologies with previously poor prognoses such as labral tears hip arthritis and femoroacetabular impingement FAI. When indicated hip arthroscopy results in shorter recovery times low complication rates and excellent outcomes in quality of life and pain regardless of age gender or activity level. The purpose of this e book is to shed light on this expanding field by delving into the common hip pathology femoroacetabular impingement its clinical relevance and to explore various surgical techniques and postoperative rehabilitation. It is our hope that this textbook provides valuable knowledge to advance the field of hip arthroscopy enhance surgical techniques and ultimately increase the quality of patient care. What's New in Hip Arthroscopy Alessandro Aprato, 2021 Hip arthroscopy has seen significant developments in the last 25 years Until a decade ago it was considered an emerging surgical

technique but today it is an established and effective treatment for various hip pathologies. The development of hip arthroscopy is strictly linked with the evolution of the concept of femoroacetabular impingement. The description of this new pathology and the open surgical treatment described by Professor Ganz were actually the basis for the development of hip arthroscopy. Femoroacetabular impingement is nowadays the main indication for hip arthroscopy. Femoroacetabular syndrome should be regarded as a triad of symptoms: clinical signs and imaging findings. The goal of the treatment in these cases should not be simple anatomic correction but to obtain a hip without impingement in the normal range of motion. In addition, labrum, cartilage, capsule and soft tissues should be evaluated and lesions should be treated. In particular, the role of the labrum has been investigated during the last several years and several techniques for labral repair and labral reconstruction have been developed. Despite the progress in diagnosis and treatment of several hip pathologies, the exact indications of hip arthroscopy are still debated. Defining the limits for arthroscopic treatment in cases of advanced osteoarthritis, bone deformity and periarticular soft tissue pathologies is one of the goals of current investigations concerning hip arthroscopy. This book is intended as a guide to the innovation and development in hip arthroscopy over the last 10 years, ranging from an update of the surgical indications to rehabilitation after hip arthroscopy. In every chapter, an expert in hip arthroscopy discusses a specific subject, focusing on latest trends and surgical techniques. Attention is focused especially on surgical indications, patient positioning and approaches, labral and capsular management, ischiofemoral impingement, management of extra-articular pathologies, trauma and finally post-operative rehabilitation.
