In-System Configuration Handbook: Neil G. Jacobson,2012-12-06 Programmable logic radically changed the electronic system design landscape It reduced board space needed for random logic state machines and system interfaces It allowed faster design cycles made easy late term bug fixes and gave designers greater freedom to experiment and prototype In system programming of these devices has had a similar revolutionary effect The ability to change the programmed content of programmable logic while it is on the board is equivalent to being able to redesign all the hardware without changing a single component This allows the possibility of providing field upgrades of your product to fix problems or to introduce new functionality It allows designing in reconfiguration as an essential function of your system with different capabilities swapped in as needed during run time Further it allows storage of different product profiles for retrieval as necessary to allow just in time configuration of systems to meet market needs Recent developments in programmable logic have helped in making realizing reconfigurable systems more streamlined The most significant development though was the introduction approval and popularization of IEEE STD 1532 the IEEE Standard for In System Configuration of Programmable Devices The purpose of this text is to bring together in a single volume the information needed by systems designers to develop applications that include configurability This covers the entire range of systems from the The In System Configuration Handbook simplest implementations that merely include configurable logic to realize system functions to the most complicated that include reconfigurability as part of the application itself **Embedded Controller Hardware Design** Ken Arnold,2001 Review of

Antenna Handbook Y.T. Lo,S. W. Lee,2013-06-29 Techniques based on the method of modal expansions the Rayleigh Stevenson expansion in inverse powers of the wavelength and also the method of moments solution of integral equations are essentially restricted to the analysis of electromagnetic radiating structures which are small in terms of the wavelength It therefore becomes necessary to employ approximations based on high frequency techniques for performing an efficient analysis of electromagnetic radiating systems that are large in terms of the wavelength One of the most versatile and useful high frequency techniques is the geometrical theory of diffraction GTD which was developed around 1951 by J B Keller 1 2 3 A class of diffracted rays are introduced systematically in the GTD via a generalization of the concepts of classical geometrical optics GO According to the GTD these diffracted rays exist in addition to the usual incident reflected and transmitted rays of GO The diffracted rays in the GTD originate from certain localized regions on the surface of a radiating structure such as at discontinuities in the geometrical and electrical properties of a surface and at points of grazing incidence on a smooth convex surface as illustrated in Fig 1 In particular the diffracted rays can enter into the GO shadow as well as the lit regions Consequently the diffracted rays entirely account for the fields in the shadow region where the GO rays cannot exist
