Paddison, Keith S. Promislow, 2008-10-15 Computational studies on fuel cell related issues are increasingly common These studies range from engineering level models of fuel cell systems and stacks to molecular level electronic structure calculations on the behavior of membranes and catalysts and everything in between This volume explores this range It is appropriate to ask what if anything does this work tell us that we cannot deduce intuitively Does the emperor have any clothes In answering this question resolutely in the affirmative I will also take the liberty to comment a bit on what makes the effort worthwhile to both the perpetrator s of the computational study hereafter I will use the blanket terms modeler and model for both engineering

and chemical physics contexts and to the rest of the world The requirements of utility are different in the two spheres As with any activity there is a range of quality of work within the modeling community So what constitutes a useful model What are the best practices serving both the needs of the promulgator and consumer Some of the key comments are covered below First let me provide a word on my credentials for such commentary I have participated in and sometimes initiated a continuous series of such efforts devoted to studies of PEMFC components and cells over the past 17 years All that participation was from the experimental qualitative side of the effort
