*Extracted* Ugo Bardi, 2014-04-09 As we dig drill and excavate to unearth the planet's mineral bounty the resources we exploit from ores veins seams and wells are gradually becoming exhausted Mineral treasures that took millions or even billions of years to form are now being squandered in just centuries or sometimes just decades Will there come a time when we actually run out of minerals Debates already soar over how we are going to obtain energy without oil coal and gas But what about the other mineral losses we face Without metals and semiconductors how are we going to keep our industrial system running Without mineral fertilizers and fuels how are we going to produce the food we need Ugo Bardi delivers a sweeping history of the mining industry starting with its humble beginning when our early ancestors started digging underground to find the stones they needed for their tools He traces the links between mineral riches and empires wars and civilizations and shows how mining in its various forms came to be one of the largest global industries He also illustrates how the gigantic mining machine is now starting to show signs of difficulties The easy mineral resources the least expensive to extract and process have been mostly exploited and depleted There are plenty of minerals left to extract but at higher costs and with increasing difficulties The effects of depletion take different forms and one may be the economic crisis that is gripping the world system And depletion is not the only problem Mining has a dark side pollution that takes many forms and delivers many consequences including climate change The world we have been accustomed to so far was based on cheap mineral resources and on the ability of the ecosystem to absorb pollution without generating damage to human beings Both conditions are rapidly disappearing Having thoroughly plundered planet Earth we are entering a new world Bardi draws
