Program Verification is the area of computer science that studies mathematical methods for checking that a program conforms to its specification This text is a self contained introduction to program verification using logic based methods presented in the broader context of formal methods for software engineering The idea of specifying the behaviour of individual software components by attaching contracts to them is now a widely followed approach in program development which has given rise notably to the development of a number of behavioural interface specification languages and program verification tools A foundation for the static verification of programs based on contract annotated routines is laid out in the book These can be independently verified which provides a modular approach to the verification of software The text assumes only basic knowledge of standard mathematical concepts that should be familiar to any computer science student It includes a self contained introduction to propositional logic and first order reasoning with theories followed by a study of program verification that combines theoretical and practical aspects from a program logic a variant of Hoare logic for programs containing user provided annotations to the use of a realistic tool for the verification of C programs annotated using the ACSL specification language through the generation of verification conditions and the static verification of runtime errors   **Theorem Proving in Higher Order Logics** Richard J.
