Graph-Based Proof Procedures for Horn Clauses RAATZ,2013-11-21 The origins of this monograph lie in my Ph D dissertation of 1987 at the University of Pennsylvania which was concerned with proof procedures for the Horn clause subset of logic The rise of logic programming has made this an important area of study All Prologs are based on a variant of resolution and inherit various properties related to this proof method This monograph studies the paradigm of logic programming in the context of graph based proof procedures which are unrelated to resolution The monograph is not a general introduction to logic programming although it is self contained with respect to the mathematics used It should appeal to the computer scientist or mathematician interested in the general area we now call computational logic A large part of the monograph is devoted to detailed proofs that the methods we present are sound and complete which in the context of the logic programming means that the operational and denotational semantics agree Graph-based Proof Procedures for Horn Clauses Stan Raatz,1990 The origins of this monograph lie in my Ph D dissertation of 1987 at the University of Pennsylvania which was concerned with proof procedures for the Horn clause subset of logic The rise of logic programming has made this an important area of study All Prologs are based on a variant of resolution and inherit various properties related to this proof method This monograph studies the paradigm of logic programming in the context of graph based proof procedures which are unrelated to resolution The monograph is not a general introduction to logic programming although it is self contained with respect to the mathematics used It should appeal to the computer scientist or mathematician interested in the general area we now call computational logic A large part of the monograph is devoted to detailed proofs that the methods we present are sound and complete which in the context of the logic programming means that the operational and denotational semantics agree An Introduction to Quantum Computing Algorithms Arthur O. Pittenger,2012-12-06 In 1994 Peter Shor 65 published a factoring algorithm for a quantum computer that finds the prime factors of a composite integer N more efficiently than is possible with the known algorithms for a classical computer Since the difficulty of the factoring problem is crucial for the security of a public key encryption system interest and funding in quantum computing and quantum computation suddenly blossomed Quantum computing had arrived The study of the role of quantum mechanics in the theory of computation seems to have begun in the early 1980s with the publications of Paul Benioff 6 7 who considered a quantum mechanical model of computers and the computation process A related question was discussed shortly thereafter by Richard Feynman 35 who began from a different perspective by asking what kind of computer should be used to simulate physics His analysis led him to the belief that with a suitable class of quantum machines one could imitate any quantum system **A Proof Theory for General Unification** W. Snyder,2012-12-06 In this monograph we study two generalizations of standard unification E unification and higher order unification using an abstract approach originated by Herbrand and developed in the case of standard first order unification by Martelli and Montanari The formalism presents the unification computation as

a set of non deterministic transformation rules for converting a set of equations to be unified into an explicit representation of a unifier if such exists This provides an abstract and mathematically elegant means of analysing the properties of unification in various settings by providing a clean separation of the logical issues from the specification of procedural information and amounts to a set of inference rules for unification hence the title of this book We derive the set of transformations for general E unification and higher order unification from an analysis of the sense in which terms are the same after application of a unifying substitution In both cases this results in a simple extension of the set of basic transformations given by Herbrand Martelli Montanari for standard unification and shows clearly the basic relationships of the fundamental operations necessary in each case and thus the underlying structure of the most important classes of term unification problems

Learning and Geometry: Computational Approaches David Kueker, Carl Smith, 2012-12-06 The field of computational learning theory arose out of the desire to formally understand the process of learning As potential applications to artificial intelligence became apparent the new field grew rapidly The learning of geometric objects became a natural area of study The possibility of using learning techniques to compensate for unsolvability provided an attraction for individuals with an immediate need to solve such difficult problems Researchers at the Center for Night Vision were interested in solving the problem of interpreting data produced by a variety of sensors Current vision techniques which have a strong geometric component can be used to extract features However these techniques fall short of useful recognition of the sensed objects One potential solution is to incorporate learning techniques into the geometric manipulation of sensor data As a first step toward realizing such a solution the Systems Research Center at the University of Maryland in conjunction with the Center for Night Vision hosted a Workshop on Learning and Geometry in January of 1991 Scholars in both fields came together to learn about each others field and to look for common ground with the ultimate goal of providing a new model of learning from geometrical examples that would be useful in computer vision The papers in the volume are a partial record of that meeting

Logical Methods John N. Crossley, Jeffrey B. Remmel, Richard Shore, Moss E. Sweedler, 1994-01-26 The twenty six papers in this volume reflect the wide and still expanding range of Anil Nerode's work A conference on Logical Methods was held in honor of Nerode's sixtieth birthday 4 June 1992 at the Mathematical Sciences Institute Cornell University 1-3 June 1992 Some of the conference papers are here but others are from students co workers and other colleagues The intention of the conference was to look forward and to see the directions currently being pursued in the development of work by or with Nerode Here is a brief summary of the contents of this book We give a retrospective view of Nerode's work A number of specific areas are readily discerned recursive equivalence types recursive algebra and model theory the theory of Turing degrees and recursive sets polynomial time computability and computer science Nerode began with automata theory and has also taken a keen interest in the history of mathematics All these areas are represented The one area missing is Nerode's applied mathematical work relating to the environment Kozen's paper builds on Nerode's early

work on automata Recursive equivalence types are covered by Dekker and Barback the latter using directly a fundamental metatheorem of Nerode Recursive algebra is treated by Ge Richards group representations Recursive model theory is the subject of papers by Hird Moses and Khoussainov Dadajanov while a combinatorial problem in recursive model theory is discussed in Cherlin Martin s paper Cenzer presents a paper on recursive dynamics

Automata Theory and its Applications Bakhadyr Khoussainov, Anil Nerode, 2012-12-06 The theory of finite automata on finite strings infinite strings and trees has had a distinguished history First automata were introduced to represent idealized switching circuits augmented by unit delays This was the period of Shannon McCullouch and Pitts and Howard Aiken ending about 1950 Then in the 1950s there was the work of Kleene on representable events of Myhill and Nerode on finite coset congruence relations on strings of Rabin and Scott on power set automata In the 1960s there was the work of Btichi on automata on infinite strings and the second order theory of one successor then Rabin s 1968 result on automata on infinite trees and the second order theory of two successors The latter was a mystery until the introduction of forgetful determinacy games by Gurevich and Harrington in 1982 Each of these developments has successful and prospective applications in computer science They should all be part of every computer scientist s toolbox Suppose that we take a computer scientist s point of view One can think of finite automata as the mathematical representation of programs that run using fixed finite resources Then Btichi s SIS can be thought of as a theory of programs which run forever like operating systems or banking systems and are deterministic Finally Rabin s S2S is a theory of programs which run forever and are nondeterministic Indeed many questions of verification can be decided in the decidable theories of these automata
